Breaking Agreements:
Distinguishing Agreement and Clitic-Doubling by Their Failures

OMER PREMINGER
MIT, April 2009

Abstract

In this paper, I propose a novel way to distinguish between agreement and clitic-doubling. The innovation lies in examining what happens when the relation between the relevant agreement-morphology and the full noun-phrase fails to obtain: whether the agreement-morpheme still shows up, bearing default $\phi$-features, or disappears altogether.

The workings of the proposed diagnostic are demonstrated using a family of constructions in “substandard” Basque (Etsepere 2006). Besides supporting the proposed diagnostic, the analysis of Basque provides a new perspective on the typological status of the Basque agreement system, as well as evidence against the traditional analysis of unergatives in Basque as being underlingly transitive.

1. Introduction

Across many languages and constructions, it is common to find sentences in which a verbal argument is represented twice: once by a full noun-phrase, and once by a phonologically small morpheme. This morpheme matches the $\phi$-features of the full noun-phrase, and is affixed either to the verb itself, or to some member of the extended verbal projection (an auxiliary verb, a tense marker, or an aspectual marker)—let us call this morpheme the agreement-morpheme, and the element to which it attaches (e.g., the verb) the host:

(1) host+[agreement-morpheme]$\phi_1$ ... <other material> ... [full noun-phrase]$\phi_1$

The linguistic literature of the past few decades has identified two kinds of operations that can give rise to this state of affairs. One is agreement, in which the host and the full noun-phrase enter into some formal relation, as a result of which features of the full noun-phrase (e.g., person, number, gender) are morphologically reflected on the host. The other operation is clitic-doubling, which generally refers to a situation in which a phonologically small, pronoun-like morpheme is generated on the basis of the full noun-phrase—with features (e.g., person, number, gender) that match the full noun-phrase—and affixes to the host.

We might have prior reason to suspect that a given morpheme comes about via agreement or via cliticization; but obviously, these preconceptions might be wrong (as Zwicky & Pullum

*Thanks to Elena Anagnostopoulou, Rajesh Bhatt, Jon Brennan, Marcel den Dikken, Sabine Iatridou, Idan Landau, David Pesetsky, Norvin Richards, Susi Wurmbrand, and especially Andrew Nevins and Milan Rezac, for discussion, comments and ideas; thanks to Cedric Boeckx, who turned my attention to these data in the first place; thanks to audiences at MIT’s Ling-Lunch, GLOW 31 (at Newcastle University), and CUNY’s Syntax-Supper; thanks to two anonymous LI reviewers; and thanks to Ricardo Etsepere and Aritz Irurtzun, who are the source of all Basque data herein, unless otherwise noted. All errors are my own.
1983 argue, regarding the English contracted negative formative -n’t). The Basque auxiliary, which is the empirical domain of this paper, is a prime example of this: at first glance, it appears that each agreement-morpheme on the Basque auxiliary enters into an agreement relation, each with a different kind of noun-phrase in the clause (absolutive, ergative, and dative). However, as will be argued here, this appearance is somewhat misleading: while the absolutive agreement-morphemes on the Basque auxiliary are indeed the result of agreement, the ergative and dative agreement-morphemes are the result of clitic-doubling (see also Arregi & Nevins 2008). It is therefore helpful to have diagnostics that determine whether the relation between an agreement-morpheme and the corresponding full noun-phrase in a given language/construction is agreement or clitic-doubling.

In this paper, I propose a novel way to distinguish between agreement and clitic-doubling, based on examining what happens when the relation in question fails to obtain. The workings of the proposed diagnostic will be demonstrated using a family of constructions in “substandard” Basque (Etxepare 2006). These constructions are a particularly useful testing ground for the proposed diagnostic, owing to the convergence of several factors: the full noun-phrase and the host are sufficiently far away from each other in these constructions (in structural terms) to allow manipulations that would otherwise be unavailable; certain aspects of Basque syntax (e.g., the structure of ditransitive verb-phrases) are well understood, and can therefore be used as a baseline; and finally, the Basque auxiliary carries multiple kinds of agreement-morphology, and thus, the results of applying the proposed diagnostic to one kind of morpheme can be contrasted with its results when applied to a different morpheme within the same construction, in the same language.

Besides supporting the proposed diagnostic, this analysis of Basque also provides an interesting typological perspective on the Basque agreement system. As mentioned above, I will argue that only the absolutive agreement-morphemes on the Basque auxiliary are the result of true agreement, while the ergative and dative agreement-morphemes are the result of clitic-doubling. Factoring out the morphology that arises via clitic-doubling therefore places the Basque agreement system on a par with systems that are familiar from nominative-accusative languages, in which agreement targets noun-phrases that bear a particular Case-marking (e.g., Icelandic, where agreement targets nominative noun-phrases, regardless of whether the subject is nominative or not; see Bobaljik 2008, Boeckx 2000, Holmberg & Hróarsdóttir 2003, Schütze 1997, among others).

In addition, it will be shown that these results cast doubt on the traditional approach to unergatives in Basque, which takes them to be underlyingly transitive, instead providing evidence that these unergatives are in fact underlyingly intransitive.

For concreteness, I assume the accounts of agreement and clitic-doubling given by Chomsky (2000, 2001) and Anagnostopoulou (2003), respectively—though as far as I can tell, the proposal is not crucially dependent on adopting these frameworks; any framework that gives a principled account of the properties in (2a–b, 3a–b), below, can be substituted for these accounts, without changing the substance of the current proposal.

---

1As pointed out by a reviewer, these data are not associated with one of the particular dialectal domains into which Basque is traditionally divided. Etxepare (2006) chooses the term “substandard” because these constructions are stigmatized, as far as standard Basque is concerned.
**Agreement**—henceforth, the *Agree* operation—can be characterized by the following properties (*Chomsky* 2000, 2001, and many others):

(2) **PROPERTIES OF Agree**

a. it is subject to *defective intervention*:
   * a host cannot *Agree* with a given noun-phrase if there is another noun-phrase structurally closer to the host (*Chomsky* 2001, McGinnis 1998, and many others)

b. it is subject to a locality condition that prevents it from operating across the boundaries of a tensed clause (e.g., *Chomsky’s* 2000, 2001 *Phase Impenetrability Condition*

The characteristics of clitic-doubling are crucially different (see Anagnostopoulou 2003, and references cited there):

(3) **PROPERTIES OF CLITIC-DOUBLING**

a. it voids the status of its target as an intervener:
   * the “chain” formed by clitic-doubling (i.e., the syntactic object consisting of the generated clitic and the full noun-phrase that it doubles) behaves as an A-chain, whose head is the clitic (*Alexiadou & Anagnostopoulou* 1997, Anagnostopoulou 1994, Sportiche 1996, 1998)
   * only the heads of A-chains can intervene (*Chomsky* 1995, *et seq.*)

b. it conforms to a locality condition that for current purposes can be approximated as the *clause-mate* relation
   * see Iatridou (1995) and related literature for more precise accounts

Note that (3b) is meant to capture the locality conditions on clitic-doubling, factoring out phenomena such as *clitic-climbing*. Crucially, clitic-climbing is widely assumed to be possible only under restructuring/“clause-union” (*Burzio* 1986, *Rizzi* 1982, *Sportiche* 1996)—and as I will show in section 2.3, the data examined here cannot be accounted for in terms of restructuring. The formulation in (3b) is therefore sufficient for the purposes of this paper.

As mentioned earlier, the novel diagnostic proposed in this paper centers around what happens when the relation in question fails to obtain. Prima facie, one might expect a failed attempt at establishing *Agree* to give rise to ungrammaticality; this is precisely what one finds in French dative experiencer constructions, for example:

(4) *Agree (AND SUBSEQUENT Move) BLOCKED BY INTERVENTION → UNGRAMMATICALITY*

?* Jean semble à Marie [ t₁ avoir du talent ].
Jean seems to Marie have.INF of talent
‘Jean seems to Marie to have talent.’  
*Anagnostopoulou* 2003:(66b)

---

2As noted by Anagnostopoulou (2003), Spanish may pose an exception to this generalization (see Torrego 1996, 1998, and the discussion in Anagnostopoulou 2003).
In (4), the dative à Marie (“to Marie”) intervenes, blocking Agree between semblé (“seem”)—or more precisely, the T₀ head to which semblé attaches—and the target noun-phrase Jean. However, if the dative intervener is moved out of the way (as in (5)), the aforementioned Agree relation can obtain (which, in French, also results in movement of the target noun-phrase to [Spec,TP]). Crucially, the configuration in which Agree is blocked results in ungrammaticality.

Nevertheless, this is not always so. As shown by Holmberg & Hróarsdóttir (2003), intervention effects in Icelandic do not give rise to outright ungrammaticality; rather, they give rise to the appearance of default number features on the probing head. Consider the following examples:

(6) **Agree WITH DOWNSTAIRS NOMINATIVE SUBJECT**

\[
\text{Manninum virðast hestarnir vera seinir. (Icelandic)}
\]

‘The man finds the horses slow.’

[Holmberg & Hróarsdóttir 2003:(11)]

(7) **Agree BLOCKED BY INTERVENTION → DEFAULT φ-FEATURES, NOT UNGRAMMATICALITY**

\[
\text{það virðist*/virðast einhverjum manni hestarnir vera seinir.}
\]

EXPL seem.sg/*seem.pl some man.sg.DAT the.horses.pl.NOM be slow

‘A man finds the horses slow.’

[Holmberg & Hróarsdóttir 2003:(12)]

In (6), the matrix verb virðast (“seem.pl”) exhibits agreement in number (albeit optionally) with the plural nominative subject of the embedded clause (hestarnir “the.horses.pl.NOM”). In (7), however, the structural position of the dative experiencer einhverjum manni (“some man.sg.DAT”) gives rise to intervention, blocking the aforementioned agreement relation.³

Crucially, this does not result in the ungrammaticality of (7); instead, the matrix verb is restricted to its default (i.e., singular) form—virðist—but the sentence remains grammatical.

The factors that determine whether a failed Agree relation results in ungrammaticality (as in the French example in (4)), or not (as in the Icelandic example in (7)), are not well-understood—nor will I provide a comprehensive account of them here.⁴ However, the behavior

³The reader may have noticed that between (6) and (7), the dative noun-phrase has changed not only its position, but also its quantificational force. That is because in Icelandic expletive-associate constructions, it is the closest noun-phrase (even if it is non-nominative) that exhibits the definiteness-effect—familiar from the behavior of nominatives in the English expletive-associate construction—in addition to being the noun-phrase that is eligible for A-movement, if an expletive is not selected (McGinnis 1998).

⁴It is somewhat suggestive that the Agree relation in (4–5), whose failure results in ungrammaticality, normally stands in a feeding relation with a movement operation—namely, movement to subject position (French not being a null-subject language). This is not true of the Agree relation in (6–7): as (6) shows, the Agree relation between the matrix verb (virðast “seem.pl”) and the downstairs nominative subject (hestarnir “the.horses.NOM”) does not feed movement, even when Agree itself is successful. This suggests that failed
of such constructions when they *are* grammatical, as in Icelandic, is not altogether surprising: agreement is essentially a feature-valuation relation; thus, if it fails for some reason, those features on the host which were supposed to be valued by the target noun-phrase are not valued—retaining their preexisting or default values. On the other hand, if *clitic-doubling* refers to the very creation of a feature-matched pronominal morpheme on the basis of an existing noun-phrase, then its failure should result in the absence of such a morpheme altogether.

The relevant contrast can therefore be stated as follows: while failed *Agree* should result in the appearance of a morpheme with default features (if the resulting utterance is grammatical at all), failed *clitic-doubling* should result in the wholesale absence of the relevant morpheme. This contrast will be undetectable, of course, if the morphological realization of default features is itself phonologically null; fortunately, this is not always so. The goal is therefore to come up with configurations in which the relevant relation between the agreement-morpheme and the host is broken, and investigate which of these two results emerges.

This is formalized below:

(8) **PROPOSED DIAGNOSTIC**

Given a scenario where the relation $R$ between an agreement-morpheme $M$ and the corresponding full noun-phrase $F$ is broken—but the result is still a grammatical utterance—the proposed diagnostic supplies a conclusion about $R$ as follows:

a. $M$ shows up with default $\varphi$-features (rather than those of $F$) $\Rightarrow R$ is *Agree*

b. $M$ disappears entirely $\Rightarrow R$ is *clitic-doubling*

Note that the proposal does not stake a claim about the deep ontology of clitics. The underlying workings of clitic-doubling are a topic of much debate in the literature (see Anagnostopoulou 1999, 2003, Jaeggli 1982, Rezac 2008a, Sportiche 1996, 1998, Suñer 1988, Torrego 1988, Uriagereka 1995, among others). Nonetheless, given the properties in (2a–b, 3a–b), it is possible to *identify* whether a relation is clitic-doubling or not—and to determine whether a novel diagnostic correlates reliably with these established properties—which is the focus of this paper.

Furthermore, the underlying nature of clitic-doubling notwithstanding, there is a sense in which (8) represents a plausible hypothesis to pursue (as alluded to earlier): given that *Agree* refers to the process of feature-valuation, rather than to the creation of any morphemes, it stands to reason that failed *Agree* would result in the spelling-out of features bearing default values (rather than in the wholesale disappearance of the agreeing morpheme). In other words, if we were to find that the facts lined up in precisely the inverse manner—that failed *Agree* resulted in the disappearance of the agreeing morpheme, while failed clitic-doubling resulted in the agreement-morpheme showing up with default feature-values—it would be more surprising than discovering that (8) holds.

The relevant Basque constructions, as well as their analysis (largely inspired by Etxepare 2006), will be introduced in section 2. In section 3, I apply the proposed diagnostic to these constructions, and show how its verdicts line up with the well-established properties
of Agree and clitic-doubling in (2) and (3), respectively. In section 4, I present one possible implementation of the proposal, in specific technical terms, to examine its potential interaction with the Person Case Constraint (PCC). Section 5 is the conclusion.

2. Apparent Long-Distance Agreement in “Substandard” Basque

2.1. A First Glance at Basque Agreement-Morphology

Consider the following Basque sentences:5

(9) EXAMPLES OF BASQUE AGREEMENT-MORPHOLOGY
   a. Gu amama-ri [ bisit-a egite- ra ] joan we(ABS) grandmother-DAT visit-ART(ABS) make-DIR gone
e- tzaizki o, 1.ABS be pl.ABS-3sg.DAT
   ‘We have gone to grandmother to make a visit.’ [Laka 1996]
   b. Guraso-e-k niri belarritako ederr-ak erosiga parent(s)-ARTpl-ERG me.DAT earring(s) beautiful-ARTpl(ABS) bought
d-i-zki da-te, 3.ABS have pl.ABS-1sg.DAT-3pl.ERG
   ‘(My) parents have bought me beautiful earrings.’ [Laka 1996]

As can be seen in these examples, the Basque auxiliary carries agreement-morphemes that reflect the number and person features of each Case-marked noun-phrase in its clause (absolutive, dative, or ergative). In the following sections, I will present two constructions that provide insight into the underlying nature of the agreement-morphemes that the auxiliary carries—in particular, into whether each kind of agreement-morpheme comes about via Agree or via clitic-doubling.

2.2. The Data

Etxepare (2006) discusses a variety of Basque in which certain constructions exhibit apparent Long-Distance Agreement (henceforth, LDA). Consider (10a–b), below:6

---
5Legend: ABS=absolutive; ADV=adverb; ART=article; AUX=auxiliary; BEN=benefactive; DAT=dative; ERG=ergative; GEN=genitive; HAB=habitual; LOC=locative; NMZ=nominalizer; NOM=nominative; PRT=participle.
6The notation “( )” represents a phonologically-empty exponent.
The examples in (10a–b) conform to the following structural description:

(11) STRUCTURAL DESCRIPTION

\[[[([DP_T \text{V}^0]\text{-tze-a})_{DP_C} \text{V}^0]_{\text{VP}} \ldots \text{aux}]_{\text{auxP}}\]

I will refer to this construction as the Case-marked construction.

DP_T refers to the noun-phrase whose plurality determines the plural morphology on the auxiliary, while DP_C refers to the entire nominalized embedded clause—including the article (-a), as well as whatever Case-marking is appropriate (-ri, when the Case is dative). Interestingly, the agreement-morpheme whose plurality is determined by DP_T is the dative agreement-morpheme on the auxiliary. This corresponds to the Case-marking on DP_C (which is dative), rather than the Case-marking on DP_T (which is absolutive).

These two Case-markings can be the same, of course:

(12) BOTH DP_T AND DP_C MARKED WITH ABSOLUTIVE CASE

\[[[\text{Nobela}_{-}\text{erromantiko-ak}]_{DP_T} \text{irakur-tze-a}]_{DP_C} \text{gustatzen} \text{novel(s)}_{-}\text{ART}_{PL}(ABS)_{-}\text{read-NMZ-ART}(ABS)_{-}\text{like}(HAB)\]

\phi_{-}\text{zai}\text{-}zki\text{-}o_{-}\text{3.ABS}_{-}\text{be}\text{-}\text{pl.ABS}_{-}\text{3sg.DAT}\]

‘He or she likes to read romantic novels.’

(subject is [pro-3sg.DAT])

[Etxepare 2006:(1b)]

In (12), both DP_C and DP_T are marked with absolutive Case, and not surprisingly, it is the absolutive agreement-morpheme on the auxiliary whose plurality is determined by the plurality of DP_T.

While the examples in (10a–b) and (12) exhibit what appears to be LDA in number features, comparable effects involving person features are unattested in the Case-marked construction:

\footnote{“T” is short for Target, “C” is short for Clausal.}
Unlike number features, person features of DP_T cannot be reflected on upstairs auxiliary (in the case-marked construction)

\[
* [\{[Zu]\}_{DP_T} \text{gobnida-tze-a}]_{DP_C} \text{baz tertu} [za-] \text{it-} \text{u-} \text{zte.}
\]

\[
\text{you(ABS)} \text{invite-NMZ-ART(ABS) refused} [2.ABS] \text{pl.ABS- have- 3pl.ERG}
\]

‘They have refused to invite you.’

(subject is [pro-3pl.ERG]) \[\text{Et}xepare 2006:(117b)\]

Note that the ungrammaticality of (13) is not a Person-Case Constraint (PCC) effect; za-it-u-zte is a possible auxiliary form in Basque, it simply cannot be used in (13). PCC effects in Basque are restricted to combinations involving dative agreement-morphemes (see Béjar & Rezac 2003, Laka 1996, Rezac 2004, 2008a, 2008b, among others; and see section 4).

Unlike the Case-marked construction, in which the nominalized clause is introduced by the article and its associated Case morphology (null, when the Case is absolutive), this variety of Basque has a construction which exhibits similar LDA-like effects, but in which the nominalized clause is introduced by the adposition \(-n\):\(^8\)

(14) **Plurality of Agreement-Morphology (on upstairs auxiliary) determined by downstairs argument (DP_T), but embedded clause introduced by \(-n\)**

a. [\{[Harri horie]k\}_{DP_T} \text{altxa-tze-n} \text{probatu} d- \text{it-} \text{u-} \text{zte.}

\[
\text{stone(s) thosepl(ABS)lift-NMZ-LOC attempted 3.ABS- pl.ABS- have- 3pl.ERG}
\]

‘They have attempted to lift those stones.’

(subject is [pro-3pl.ERG]) \[\text{Et}xepare 2006:(85a)\]

b. Jon-i [[kopla horie]k]_{DP_T} \text{kanta-tze-n} \text{entzun}

Jon-DAT \text{song(s) thosepl(ABS)sing-NMZ-LOC heard}

\[
3.ABS- \text{have- pl.ABS- 3sg.DAT- 1sg.ERG}
\]

‘I have heard/listened to Jon singing those songs.’

(subject is [pro-1sg.ERG]) \[\text{Et}xepare 2006:(88a)\]

The examples in (14a–b) conform to the following structural description:

(15) **Structural Description**

\[[[[DP_T V^0]-tze-n]_{PP} V^0]_{VP} \ldots \text{aux}]_{auxP}\]

I will refer to this construction as the *adpositional construction*.

\(^8\)There is a similar construction involving the adposition \(-ko\), rather than \(-n\):

(i) **Plurality of Agreement-Morphology (on upstairs auxiliary) determined by downstairs argument (DP_T), but embedded clause introduced by \(-ko\)**

a. [[Liburu-ak]_{DP_T} \text{itzul-tze-ko} \text{eskatu} d- \text{i-} \text{zk}i\text{-} o- \text{t.}

\[
\text{book(s)-ARTpl(ABS)return-NMZ-GEN.LOC asked 3.ABS- have- pl.ABS- 1sg.DAT- 3pl.ERG}
\]

‘They have asked me to return the books.’

(subject is [pro-3pl.ERG], experiencer argument is [pro-1sg.DAT]) \[\text{Et}xepare 2006:(114b)\]

However, the status of \(-ko\)-phrases with respect to the presence or absence of the article is more difficult to ascertain. I will therefore leave \(-ko\)-phrases aside for the purposes of this paper.
Given (14a–b), in which the embedded clause contains a single overt argument marked with absolutive Case, one might expect to find comparable instances of apparent LDA into an adpositional clause that contains a single overt argument marked with dative Case. Interestingly, this expectation is not realized—targeting a dative DP in the adpositional construction is impossible:

(16) **UNLIKE ABSOLUTIVE DOWNSTAIRS ARGUMENTS, DATIVE ONES CANNOT BE TARGETED**

* [[Agindu-e-i]_{DP_T} kasu egi-te-n ] saiatu order(s)-ART_{pl}-DAT attention pay-NMZ-LOC try

\[
\text{nin- tza- } \phi- e- n. \\
1.ABS- be- sg.ABS-3pl.DAT PAST
\]

‘I tried to pay attention to the orders.’

(subject is [pro-1sg.ABS])

In contrast to the Case-marked construction, the adpositional construction does allow for the person features of the agreement-morphemes on the auxiliary to be determined by the person features of DP_{T} (on a par with its ability to reflect the number features of DP_{T}). There is a slight complication here, which is that the morphological paradigms for three-place auxiliaries (i.e., auxiliaries that simultaneously carry agreement-morphemes corresponding to absolutive, dative, and ergative noun-phrases) lack entries corresponding to 1\textsuperscript{st}/2\textsuperscript{nd}-person absolutive (an instance of the PCC; see section 4); and as shown above, only absolutive noun-phrases can be targeted in the adpositional construction. Therefore, if the configuration calls for a three-place auxiliary, there is no way to realize the person features of DP_{T} on the auxiliary. PCC effects also arise in certain contexts involving two-place auxiliaries, that encode only absolutive and dative agreement-morphology (see Rezac 2008b for details). To avoid this confound, one must construct examples that call for an auxiliary that encodes only absolutive and ergative agreement-morphology. Fortunately, this is possible, even within the confines of the adpositional construction:

(17) **IN THE ADPOSITIONAL CONSTRUCTION, AUXILIARY CAN REFLECT THE PERSON FEATURES OF DP\textsubscript{T}**

[[Ni]_{DP_T} altxa-tze-n ] probatu na\textsuperscript{-} u\textsuperscript{-} te. me(ABS) lift-NMZ-LOC attempted 1.ABS sg.ABS have-3pl.ERG

‘They attempted to lift me.’

(subject is [pro-3pl.ERG])

As (17) shows, when one controls for the availability of morphological forms, the auxiliary in the adpositional construction will reflect the person features of DP_{T}, as well as its number features.

Note that in both the Case-marked construction and the adpositional construction, we find the morpheme -tze—which is widely considered to be a nominalizer, on a par with English gerund morphology (Trask 2003). I will therefore consider it a head of category \(n^0\) (due to its nominalizing function), which projects a phrase of category \(nP\).
2.3. The Prospects for a Restructuring Account

In this subsection, I address the possibility of providing a restructuring account for the LDA-like effects in the Case-marked construction and in the adpositional construction—in other words, for the presence of agreement-morphemes on the upstairs auxiliary that reflect the \( \varphi \)-features of an argument of the downstairs predicate. If restructuring is indeed “clause-union”, such an analysis makes the prediction that arguments of the downstairs verb would behave—for Case/agreement purposes—as if they were part of the upstairs clause.

Recall that in simple, mono-clausal constructions, the Basque auxiliary carries agreement-morphemes that match both the number features and the person features of its clause-mate arguments—be they absolutive, dative, or ergative (see section 2.1). In the Case-marked construction, however, only the number features of DP\( _T \)—the argument of the embedded verb—are reflected by the agreement-morphemes of the upstairs auxiliary (as shown in (12), repeated below), to the exclusion of its person features (as shown in (13), repeated below):

\[
(12) \text{ \textit{IN THE CASE-MARKED CONSTRUCTION, THE AUXILIARY CAN REFLECT THE NUMBER-FEATURES OF DP}_T, \ldots} \\
[\text{\[\text{Nobela } \text{erromantiko-ak}\]}\text{DP}_T\text{ irakur-tze-a }\text{DP}_C\text{ gustatzen}] \\
\varphi-\text{zai-zki} \text{ o.} \text{3.ABS- be-} \text{pl.ABS} \text{- 3sg.DAT} \\
\text{‘He or she likes to read romantic novels.’} \\
\text{(subject is [pro-3sg.DAT])} \text{[Etxepare 2006:(1b)]}
\]

\[
(13) \ldots \text{BUT NOT ITS PERSON-FEATURES} \\
* [\text{\[\text{Zu}\]}\text{DP}_T\text{ gonzbida-tze-a }\text{DP}_C\text{ bazturtu}\text{za- it- u- zte.}] \\
\text{you(ABS)invite-NMZ-ART(ABS) refused 2.ABS pl.ABS- have- 3pl.ERG} \\
\text{‘They have refused to invite you.’} \\
\text{(subject is [pro-3pl.ERG])} \text{[Etxepare 2006:(117b)]}
\]

Thus, arguments of the downstairs verb do not behave—for Case/agreement purposes—as if they were part of the upstairs clause. This is contrary to the expectation that a restructuring/“clause-union” account would generate.

One may seek to salvage a restructuring account for the Case-marked construction, by assuming that it is an instance of partial restructuring—namely, that the embedded domain contains the functional layer relevant to person agreement, but lacks the functional layer relevant to number agreement. Thus, the number features of DP\( _T \) would be able to trigger agreement on the upstairs number agreement layer, whereas the person features of DP\( _T \) will already have triggered agreement on the embedded person agreement layer, rendering the person features of DP\( _T \) inactive and invisible to the upstairs person agreement layer. However, this requires separate \( \varphi \)-features of the same noun-phrase to be activated and inactivated independently of each other—and in particular, it requires the person features of DP\( _T \) to become inactivated (and therefore invisible) at the same point in the derivation where the number features of the very same noun-phrase are still active and visible. This conflicts with the established mechanics of defective intervention: it is the noun-phrase as a whole (i.e., its
complete set of $\varphi$-features) that is either active or inactive (see the discussion in Chomsky 2000:p. 124; and in Chomsky 2001:p. 15).

In the adpositional construction, though both the number features and the person features of DP$_T$ can be reflected by the agreement-morphemes of the upstairs auxiliary, both sets of features can be reflected only if DP$_T$ is absolutive (as in (14a), repeated below), not if it is dative (as in (16), repeated below):

(14)  
\begin{enumerate}
  \item **IN THE ADPOSITIONAL CONSTRUCTION, AN ABSOLUTIVE DOWNSTAIRS ARGUMENT CAN BE TARGETED, \ldots**
  
\begin{align*}
  \text{[[Harri horiek]}_{\text{DP}_T} & \text{altxa-tze-n }] \text{ probatu d-it- u-zte.} \\
  \text{stone(s) those}_{\text{pl}}(\text{ABS}) & \text{lift-NMZ-LOC attempted }3.\text{ABS-}_{\text{pl}}\text{ABS} \text{ have- 3pl.ERG}
  \\
  \text{‘They have attempted to lift those stones.’ (subject is [pro-3pl.ERG]) [Etxepare 2006:(85a)]}
\end{align*}
\end{enumerate}

(16)  
\begin{enumerate}
  \item **BUT NOT A DATIVE ONE**

  \text{1.ABS- be- } & \text{sg.ABS-}_{\text{3pl.DAT}} \text{ PAST}
  \\
  \text{‘I tried to pay attention to the orders.’ (subject is [pro-1sg.ABS])}
\end{align*}
\end{enumerate}

Thus, in the adpositional construction, dative arguments of the downstairs verb do not behave—for Case/agreement purposes—as if they were part of the upstairs clause. Again, this is contrary to the expectation that a restructuring/“clause-union” account would generate.

Again, one may seek to salvage a restructuring account by assuming partial restructuring—in particular, that the embedded domain contains the functional layer relevant to dative agreement, but lacks the functional layer relevant to absolutive agreement. Thus, an absolutive DP in the embedded domain will be able to trigger agreement on the upstairs absolutive agreement layer, whereas a dative DP in the embedded domain will already have triggered agreement on the downstairs dative agreement layer, rendering its own $\varphi$-features inactive and invisible to the upstairs dative agreement layer. There are two main reasons to reject such an account. First, it is not clear why such dative agreement in the embedded clause would lack any overt manifestation—in stark contrast to the general pattern of dative agreement in Basque. More importantly, however, section 3 will show converging evidence that the dative agreement-morpheme in Basque is not a reflex of Agree at all, but rather the result of clitic-doubling; as such, it should not be subject to the logic of activation and inactivation, needed for a partial restructuring account.

It therefore appears that both in the Case-marked construction and in the adpositional construction, the presence of agreement-morphemes on the upstairs auxiliary that reflect the $\varphi$-features of an argument of the downstairs verb cannot be accounted for in terms of restructuring.

Note also that the same facts preclude an analysis of either the Case-marked construction or the adpositional construction in terms of movement of the embedded argument (i.e., DP$_T$)
into the matrix clause (along the lines of object shift in Scandinavian languages). If DP_T in the Case-marked construction occupied a position in the matrix clause, the auxiliary would be able to reflect its person features, as well as its number features—contra (13). Similarly, if DP_T in the adpositional construction occupied a position in the matrix clause, the auxiliary would be able to reflect its features even if it were dative—contra (16).

2.4. Analyzing the Two Constructions

In this subsection, I present an analysis of the two LDA-like constructions introduced in section 2.2. The analysis—particularly, of the Case-marked construction—is very much inspired by Etxepare’s (2006) analysis.

As discussed earlier, the distinctive feature of the Case-marked construction is the appearance of the article, along with its associated Case-marking morphology (which is null, when the Case is absolutive). Let us therefore take a closer look at the morphology of the Basque article:

\[
\begin{array}{c|c}
\text{sg.} & -a \\
\text{pl.} & -ak
\end{array}
\]

It seems plausible that the Basque article is in fact composed of two independent parts: an invariant -a morpheme, and a number morpheme, which is -k when \([\text{NUM}=p]\), and either null or missing when \([\text{NUM}=s]\) (see Trask 2003, where a similar analysis is adopted for Basque).

On the basis of this observation, I will adopt Etxeberria’s (2005) proposal for the general structure of noun-phrases in Basque, which assumes a NumP projection between NP and DP (Ritter 1991, 1992):

\[
\begin{array}{l}
\text{(19) GENERAL STRUCTURE OF THE BASQUE NOUN-PHRASE}
\end{array}
\]
The Basque D^0 enters the derivation bearing an unvalued number feature (marked \([\text{NUM}=\_]\) in (19a–b)). This feature probes for a valued counterpart with which it can establish an Agree relation, and finds one on Num^0. Since D^0 and Num^0 are in an immediate c-command relation, Num^0-to-D^0 head-movement is triggered (see Pesetsky & Torrego 2001, where it is argued that this is a general property of such a configuration). This results in the fusing of the -a morpheme (associated with D^0) and the -k or -φ morpheme (associated with Num^0) into what we might call “the article” (i.e., -a(k)).

On this view, -k is not the phonological realization of \([\text{NUM}=\text{pl}]\) on D^0; rather, it is the phonological realization of \([\text{NUM}=\text{pl}]\) on Num^0 (which then undergoes head-adjunction to D^0).

With nominalized clauses in the Case-marked construction (i.e., those Case-marked nominalized clauses which give rise to LDA-like effects), one finds only the -a form of “the article” (to the exclusion of -ak). This suggests that in the Case-marked construction, D^0_C selects nP (the phrase headed by -tze) directly—rather than selecting a NumP:

(20) **EMBEDDED STRUCTURE IN THE CASE-MARKED CONSTRUCTION**

By hypothesis, D_C^0 carries an unvalued number feature \([\text{NUM}=\_]\), as any other D^0 head would. As usual, this feature will probe in search of a valued number feature with which to establish an Agree relation. In this situation, however, there is no number feature on the category that is the immediate complement of D^0 (the -tze-phrase, labeled nP). In fact, there is arguably no closer number feature than the one on DP_T (the argument of the embedded verb).^9

The nominalized embedded clauses in question (both in the Case-marked construction and in the adpositional construction) exhibit the characteristics of obligatory control (see Etxepare 2006 for the relevant diagnostics). Thus, following Wurmbrand’s (2001) analysis of obligatory

---

^9This valued number feature on DP_T will itself have come about by virtue of an unvalued number feature \([\text{NUM}=\_]\) on D_T^0 (the head of DP_T) having agreed with a valued number feature on the head of the NumP complement of D_T^0—in the same manner shown in (19).
control complements, I will assume that the complement of \([-tze\]_n^o\) in these constructions is a bare VP.\(^{10}\) The unvalued number feature on D\(_C^0\) is therefore able to probe into that VP, and establish an Agree relation with an argument within it (i.e., with DP\(_T\), an argument of the downstairs V\(^0\)).

This is schematized below:

\[
\text{(21) } D_C^0 \text{ PROBES FOR (AND Agrees WITH) VALUED NUMBER FEATURE, FOUND ON DP}_T
\]

In (21), there are intervening heads between D\(_C^0\) and D\(_T^0\)—namely, V\(^0\) and \([-tze\]_n^o\), at the very least. Hence, head-movement of the kind shown in (19a–b) cannot arise here (because of the Head-Movement Constraint; Travis 1984). The morpheme in D\(_T^0\) (\(-a\) if DP\(_T\) is singular, \(-ak\) if it is plural) is therefore unable to move to D\(_C^0\). This derives the fact that the article that introduces DP\(_C\) is always \(-a\), and in particular, that it never carries the \(-k\) morphology.\(^{11}\)

On this view, apparent LDA in the Case-marked construction is in fact comprised of two separate relations, “stacked” on top of one another, with D\(_C^0\) serving as an intermediary. The first is Agree between D\(_C^0\) and DP\(_T\), as outlined above. The second is the relation between the auxiliary and DP\(_C\). Let us refer to the Case-marking on DP\(_C\) as M\(_C\). Since DP\(_C\) occupies a

\(^{10}\)Etxepare (2006) actually argues that these constructions involve a full vP (I thank a reviewer for clarifying this). If this is correct, then either (i) the absolutive DPs targeted in these constructions must first move to the periphery of this vP, to escape locality violations, or (ii) this vP does not constitute a locality boundary, on a par with vPs in raising/passive/unaccusative structures in English (cf. a phase-inducing vP, as discussed in section 3.5). In either case, reference to “VP” in the text can be replaced with reference to such a vP; in the interest of simplicity, I will maintain the label “VP” in the text. This is not to be taken as an argument against Etxepare’s analysis.

\(^{11}\)As a reviewer points out, one could envision a state of affairs in which plural morphology arises on D\(^0\) precisely as a reflex of long-distance Agree (of the kind schematized in (21)), contrary to fact. The current analysis therefore relies on the assumption, stated earlier, that \(-k\) is the phonological realization of [NUM=pl] on Num\(^0\) (rather than D\(^0\)), while number features on D\(^0\) have no phonological reflex unto themselves.
canonical argument position, whatever mechanism gives rise to agreement with $M_C$-marked noun-phrases in straightforward mono-clausal constructions in Basque (whether it is Agree or clitic-doubling) will operate here as well. Thus, the agreement-morpheme corresponding to $M_C$-marked arguments will reflect the number feature that has been transmitted from $DP_T$ to $D_C^0$ via Agree in (21).

In contrast to number features, and their morphological realization as -$k$ when [NUM=pl], Basque has no sign of person-morphology on the article. Therefore, an analogous account involving person features is far less plausible.12 The existence of number-morphology on the Basque article, and the absence of comparable person-morphology, thus derives the lack of comparable LDA-like effects in person features—as exemplified by the contrast between (12) and (13), repeated here:

(12) **IN THE CASE-MARKED CONSTRUCTION, THE AUXILIARY CAN REFLECT THE NUMBER-FEATURES OF $DP_T$, ...**

\[
\begin{array}{ll}
\phi- & \text{zai}\text{-}\text{zki} & \text{o.} \\
3.\text{ABS}- & \text{be-} & \text{pl.ABS}\text{-} & 3sg.DAT \\
\end{array}
\]

‘He or she likes to read romantic novels.’

(subject is [pro-3sg.DAT]) [Etxepare 2006:(1b)]

(13) **... BUT NOT ITS PERSON-FEATURES**

\[
\begin{array}{ll}
* & \text{[}[	ext{Zu}]_{DP_T}\text{] gonzida-tze-a }]_{DP_C} & \text{bazturtza}\text{-}zta & \text{itize-} & \text{u-} & \text{zte.} \\
\text{you(ABS)} & \text{invite-NMZ-ART(ABS)} & \text{refused} & \text{2.ABS}\text{-} & \text{pl.ABS}\text{-} & \text{have-} & \text{3pl.ERG} \\
\end{array}
\]

‘They have refused to invite you.’

(subject is [pro-3pl.ERG]) [Etxepare 2006:(117b)]

Further support for the crucial role of $D_C^0/DP_C$, as an intermediary in the transmission of number features from $DP_T$ to the auxiliary, comes from the comparison with the adpositional construction, in which the auxiliary is able to reflect the person features of $DP_T$ (a point to which I will return shortly). Briefly, the adpositional construction lacks a DP layer (as will be shown), and therefore lacks a comparable intermediary in the transmission of features from the embedded noun-phrase to the upstairs auxiliary; consequently, there is no asymmetry between the transmission of number features and the transmission of person features (also demonstrating that there is nothing intrinsically problematic with agreement in Basque targeting the person features of a noun-phrase that is in an embedded clause).

This analysis of the Case-marked construction shares with Etxepare’s (2006) account the pivotal role of $D_C^0/DP_C$ in the transmission of number features in the Case-marked construction. In Etxepare’s account—unlike the current account—the $\phi$-features on the auxiliary/agreement-morpheme enter into two Agree relations: one with $DP_C$ in its entirety, and another with $DP_T$ (on the issue of a single probe entering into multiple Agree relations, see

---

12As pointed out by a reviewer, this approach is reminiscent of Kayne’s (2000) analysis of Romance 3rd person pronouns as “determiner pronouns” (i.e., determiners that have acquired number and gender morphology).
Anagnostopoulou 2003, 2005, Bhatt 2005, Richards 2005). DP_C, in Etxepare’s account, has 3rd-person features, but no number features; it therefore values the person features on the probe, but does not value its number features. Subsequent Agree by the same probe must therefore target goals with the same person value (namely, 3rd-person; see Anagnostopoulou 2003, 2005, Richards 2005). Thus, we get the appearance that the auxiliary/agreement-morpheme can agree in number, but not in person, with DP_T.

Under the current account, in contrast, there are two probes—the auxiliary/agreement-morpheme and D_0—that each probe exactly once. The role that D_0 plays in the current account—a probe that initiates its own Agree operations with DP_T—allows a straightforward account for the susceptibility of the LDA-like effects in the Case-marked construction to intervention, even when the relation between the upstairs auxiliary/agreement-morpheme and DP_C is a kind of relation that is clearly not susceptible to intervention (such as the relation that gives rise to dative agreement-morphology; see section 3.3).

In the adpositional construction, the nominalized clause (i.e., the nP headed by the nominalizing morpheme, [-tze]_{n^0}) is not selected by the article; rather, it is selected by the adposition [-n]_{p^0} directly (see also Laka 2006a,b). Recall (14a), repeated here:

(14) a. **NO ARTICLE IN THE ADPOSITIONAL CONSTRUCTION**

    [[[Harri horiek]_{DP_T} altxa-tze-n ] probatu d- [it] u- zte.]
    [+stone(s) those_{pl(ABS)} lift-NMZ-LOC attempted 3.ABS-{pl.ABS} have- 3pl.ERG

    ‘They have attempted to lift those stones.’
    (subject is [pro-3pl.ERG])

    [Etxepare 2006:(85a)]

The fact that the article is indeed absent between the nominalizer (-tze) and the adposition (-n) can be seen in the behavior of the same adposition when it selects a lexical noun-phrase directly:13

(22) **ARTICLE IS DISCERNIBLE IN SIMILAR PHONOLOGICAL ENVIRONMENTS**

    a. % etxe-n  
    house-LOC  
    ‘at home (lit.: in a house)’

    b. etxe-a-n  
    house-ART-LOC  
    ‘in the house’

As shown in (22), the article (-a) is discernible before -n, even in post-vocalic position. Crucially, the adpositional construction (e.g., (14a)) is on a par with (22a), rather than (22b). The nominalizing morpheme (-tze) and the adposition (-n) appear adjacent to each other, without the article (-a) between them.

Since there is no evidence of a DP layer between the adposition (-n) and the nominalizing morpheme (-tze), the adpositional construction can be handled in terms of a direct relation between the upstairs auxiliary and an argument of the embedded verb, as illustrated in (23):

---

13A reviewer points out that the form in (22a) is a historical residue, and is possible only in a handful of eastern varieties of Basque. The availability of (22a), however, is not crucial to the argument in the text, which relies on the discernibility of the article (-a) in (22b). Crucially, the form in (22b) is universally accepted by Basque speakers.
The subordinating verb takes a PP complement headed by \([-n]\)\(_{p^0}\), which itself takes as its complement an \(n\)P headed by \([-tze]\)\(_{p^0}\), which itself takes a VP as its complement.

Since in (23), there is no locality boundary (DP, CP, or \(vP\)) between the auxiliary and \(D_{T}\), the relation between the two is on a par with agreement in the English expletive-associate construction, as far as locality is concerned:

\[
(24) \quad \textit{AGREEMENT IN THE ENGLISH EXPLETIVE-ASSOCIATE CONSTRUCTION}
\]

there were likely [to appear [to be arrested [\(D_P\) three men]]]

In (24), agreement on the auxiliary (\(were\)) is determined by the plurality of \(three\) \(men\). This relation, just like the one proposed in (23), does not span the boundaries of a DP, a CP, or an active-transitive \(vP\).

This analysis of the adpositional construction makes a further prediction, regarding person features. Recall that in the Case-marked construction, what appeared to be a single long-distance agreement relation was in fact broken down into two relations, each of which is perfectly local, and which are “stacked” on top of one another: the relation between \(D_{C}^{0}\) (the head of the enclosing DP layer) and \(D_{T}\), which was analyzed as an \(Agree\) relation, and the relation between the auxiliary and \(D_{C}\). The presence of an unvalued number feature on \(D_{C}^{0}\) is what allows the number features that originated on \(D_{T}\) to show up on the auxiliary.

In the proposed analysis of the adpositional construction, however, there is no comparable intermediary. Under the current proposal, the adpositional construction is an instance of the upstairs auxiliary agreeing with \(D_{T}\) directly; and in simple, mono-clausal constructions, the Basque auxiliary carries agreement-morphemes that match both the number features and the person features of its clause-mate arguments. Thus, we predict that the auxiliary should be able to reflect the person features of \(D_{T}\), as well as its number features. As shown in (17) (repeated here), this is indeed true: \(^{14}\)
IN THE ADPOSIONAL CONSTRUCTION, THE AUXILIARY CAN REFLECT PERSON FEATURES OF DPₜ

\[
[ [ \text{[Ni]}_{DPₜ} \text{altxa-tze-n }] \text{ probatu } \text{na-} \text{φ-} \text{u-te.} \\
\text{me(ABS)} \text{lift-NMZ-LOC attempted } \text{1.ABS} \text{ sg.ABS- have- 3pl.ERG}
\]

‘They attempted to lift me.’
(subject is [pro-3pl.ERG])

The example in (17) also demonstrates that when one controls for interfering factors (such as the PCC), one finds that there is nothing intrinsically wrong with agreement in person (as well as in number) between the auxiliary and a noun-phrase in an embedded clause in Basque.

As mentioned earlier, the impossibility of determining person agreement-morphology in the Case-marked construction (as opposed to the adpositional construction) supports the notion that it is indeed D₀C—which I have called the intermediary—whose features are responsible for transmitting feature-values from DPₜ to the agreement-morphemes in the Case-marked construction. The fact that D₀C (like any other D₀) has number features but no person features, accounts for the asymmetry between number and person in the Case-marked construction.¹⁵

On this account, there is no difference in the syntax internal to the -tze-phrase (i.e., the nP), between instances where it is selected by the article (i.e., the Case-marked construction), and instances where it is selected by an adposition (i.e., the adpositional construction). In both constructions, [-tze]ₙ₀ selects a VP as its complement; the differences between the two constructions follow from the difference in the category that selects the -tze-phrase (see section 3.5, regarding the source of variation between varieties of Basque that do and do not exhibit these LDA-like effects).

3. Agree and Clitic-Doubling in Basque

As outlined in the INTRODUCTION, the goal of this paper is to demonstrate a novel diagnostic for distinguishing Agree from clitic-doubling—summarized in (8), repeated here:

(8) PROPOSED DIAGNOSTIC

Given a scenario where the relation R between an agreement-morpheme M and the corresponding full noun-phrase F is broken—but the result is still a grammatical utterance—the proposed diagnostic supplies a conclusion about R as follows:

a. M shows up with default \( φ \)-features (rather than those of \( F \)) \( \Rightarrow \) R is Agree
b. M disappears entirely \( \Rightarrow \) R is clitic-doubling

¹⁴See section 2.3 for why the distribution of agreement-morphemes in this construction cannot be analyzed in terms of restructuring (or partial restructuring) alone.

¹⁵The analysis of the Case-marked construction as “stacked” agreement, with D₀C serving as the intermediary, is reminiscent of Rezac’s (2004) treatment of copy-raising as an instance of “stacked” \( φ \)-agreement with C₀ serving as the intermediary, as well as Rezac’s (2008a) treatment of dative-displacement in Basque dialects as an instance of “stacked” \( φ \)-agreement with (dative) P₀ serving as the intermediary. In the latter, Rezac exploits the fact that P₀ can be specified for only a subset of the \( φ \)-features for which clausal \( φ \)-probes are specified, much in the same way the lack of person features on the Basque D₀ (and in particular, on D₀C) is exploited here.
In the following subsections, I apply this diagnostic to the various agreement-morphemes found on the Basque auxiliary, using the constructions introduced in section 2 (and in particular, their limitations) to generate configurations in which the relation between the agreement-morpheme and the full noun-phrase whose \( \phi \)-features it matches breaks down. I show that systematically, the verdict provided by the proposed diagnostic lines up with the characteristics of \textit{Agree} and clitic-doubling—as identified in (2) and (3), respectively, and repeated here: \(^{16}\)

(2) PROPERTIES OF \textit{Agree}

a. is subject to defective intervention (Chomsky 2001, McGinnis 1998, and many others)

b. is subject to a locality condition that prevents it from operating across the boundaries of a tensed clause (e.g., Chomsky’s 2000, 2001 \textit{Phase Impenetrability Condition})

(3) PROPERTIES OF CLITIC-DOUBLING

a. voids the status of its target as an intervener (Anagnostopoulou 2003)

b. conforms to a locality condition that for current purposes can be approximated as the \textit{clause-mate} relation (see Iatridou 1995 and related literature)

3.1. \textit{Agree} vs. Clitic-Doubling in the Adpositional Construction

As shown in section 2.2, an absolutive DP \( T \) can be targeted in the adpositional construction, but a dative one cannot—recall the contrast between (14a) and (16), repeated here:

(14) a. \textit{IN THE ADPOSITIONAL CONSTRUCTION, AN ABSOLUTIVE DOWNSTAIRS ARGUMENT CAN BE TARGETED}, . . .

\[
\text{[[Harri horiek]}_{DP_T} \text{altxa-tze-n} ] \text{probatu d-\text{it}-u-zte.}\]

\( \text{Those downstairs attempted to lift it.} \)

(subject is \([pro-3pl.\text{ABS}]) \quad \text{[Etchepare 2006:(85a)]}

(16) \ldots \text{BUT NOT A DATIVE ONE}

* [[Agindu-e-i]}_{DP_T} \text{kasu egi-te-n } ] \text{saiatu}

\( \text{The orders tried to pay attention.} \)

(subject is \([pro-1sg.\text{ABS}])

\( \text{1.ABS- be- sg.ABS-3pl.DAT; PAST}\)

Whatever the reasons for this may be, it is quite clear that the relation that gives rise to the dative agreement-morpheme breaks down in the adpositional construction. It is therefore

\(^{16}\text{As noted in the INTRODUCTION, (3b) is meant to capture the locality conditions on clitic-doubling, factoring out phenomena such as clitic-climbing. Crucially, clitic-climbing is widely assumed to be possible only under restructuring/“clause-union” (Burzio 1986, Rizzi 1982, Sportiche 1996)—and as shown in section 2.3, the data examined in this paper cannot be accounted for in terms of restructuring. The formulation in (3b) is therefore sufficient for the present purposes.}
crucial, within the framework of the current proposal, to determine which of the following two repairs would render (16) grammatical: employing a dative agreement-morpheme with default features (which would indicate that the dative agreement-morpheme comes about by virtue of \textit{Agree}), or eliminating the dative agreement-morpheme altogether (which would indicate that the dative agreement-morpheme comes about by virtue of clitic-doubling).

As shown in (25), below, using an auxiliary whose dative agreement-morpheme reflects default features (i.e., 3rd-person singular)—rather than the features of the dative DP$_T$—does not salvage (16):

\begin{equation}
\text{(25) USING A DATIVE AGREEMENT-MORPHHEME THAT REFLECTS DEFAULT } \phi \text{-FEATURES DOES NOT SALVAGE (16)}
\end{equation}

\begin{align*}
&\left[ [\text{Agindu-e-i}]_{\text{DP}_T} \right. \\
&\text{order(s)-ART}_{\text{pl}} \text{-DAT attention pay-NMZ-LOC try} \\
&\text{nin- tzai- } \phi - \varnothing - n. \\
&1.\text{ABS- be- sg.ABS-3sg.DAT- PAST} \\
&'I \text{ tried to pay attention to the orders.}' \\
&\text{(subject is } [\text{pro-1sg.ABS}])
\end{align*}

On the other hand, using an auxiliary that lacks a dative agreement-morpheme altogether (i.e., an auxiliary that carries only absolutive agreement-morphemes) renders the sentence grammatical:

\begin{equation}
\text{(26) USING AUXILIARY THAT HAS NO DATIVE AGREEMENT-MORPHHEME SALVAGES (16)}
\end{equation}

\begin{align*}
&\left[ [\text{Agindu-e-i}]_{\text{DP}_T} \right. \\
&\text{order(s)-ART}_{\text{pl}} \text{-DAT attention pay-NMZ-LOC try} \\
&\text{1sg.ABS- be- PAST} \\
&'I \text{ tried to pay attention to the orders.}' \\
&\text{(subject is } [\text{pro-1sg.ABS}])
\end{align*}

In other words, the relation between the dative agreement-morpheme and the dative noun-phrase behaves—according to the proposed diagnostic—as a clitic-doubling relation.

Crucially, the conclusion that the dative agreement-morpheme is the result of clitic-doubling (rather than \textit{Agree}) fits well with the previously established properties of clitic-doubling. One source of corroborating evidence is the behavior of dative agreement-morphemes with respect to defective intervention; this will be discussed in section 3.2.

A second source of corroborating evidence has to do with locality restrictions. Recall that clitic-doubling is expected to adhere to the \textit{clause-mate} restriction (since in these contexts, clitic-climbing is ruled out; see the discussion in the \textit{Introduction} and in section 2.3). Looking again at the ungrammaticality of (16), it appears that something like the clause-mate restriction is indeed operative:\textsuperscript{17}
AUXILIARY AND DATIVE DP_T ARE IN SEPARATE CLAUSES → CLITIC-DOUBLING
BLOCKED

* [[Agindu-e-i]_{DP_T} kasu egi-te-n ] saiatu
    order(s)-ART_{pl-DAT} attention pay-NMZ-LOC try

    nin- tzaį- ϕ- [e]_{T} n.
    1.ABS- be- sg.ABS-{3pl.DAT} PAST

'I tried to pay attention to the orders.'
(subject is [pro-1sg.ABS])

In (16), the dative DP_T and the auxiliary are in separate clauses. If dative agreement-morphemes are indeed the result of clitic-doubling (and therefore, subject to the clause-mate restriction), it is to be expected that generating a dative agreement-morpheme based on the ϕ-features of a dative noun-phrase in a separate clause would be impossible.  

An immediate consequence of the same approach is that unlike their dative counterparts, absolutive agreement-morphemes cannot be the result of clitic-doubling. That is because absolutive agreement-morphemes in the adpositional construction are able to reflect the ϕ-features of an absolutive DP_T located in the embedded clause—as in (14a), repeated here:

(14) a. A "REGULAR" EXAMPLE OF THE ADPOSITIONAL CONSTRUCTION, TARGETING AN ABSOLUTIVE DP_T

[[Harri horiek]_{DP_T} altxa-tze-n ] probatu d-it-u- zte.
    stone(s) those_(ABS) attempt lift-NMZ-LOC attempted 3.ABS-{pl.ABS} have- 3pl.ERG

'They have attempted to lift those stones.'
(subject is [pro-3pl.ERG])

[Etxepare 2006:(85a)]

Since the auxiliary and DP_T are not in a clause-mate relation in (14a), and the relation responsible for generating absolutive agreement-morphemes can still obtain, the relation must be Agree (rather than clitic-doubling).

A reviewer asks if the absence of a dative agreement-morpheme on the auxiliary in cases like (26), repeated below, can be seen as a conclusive indicator of failed clitic-doubling, given that there is a sense in which the matrix verb saiatu ("try") does not "need" dative agreement-morphology in the first place: it selects an absolutive subject—in this case, pro-1sg.ABS—and an adpositionally-headed clausal complement; it does not, however, select a dative argument.

---

17A reviewer suggests a slightly different approach to the facts in (16, 25–26), whereby dative agreement-morphemes on the auxiliary are licensed by an applicative projection—and it is this applicative projection, rather than the dative noun-phrase itself, that must be in a clause-mate relation with the auxiliary. Under this approach, what prevents dative agreement-morphemes in a sentence like (16), is that an applicative projection in the downstairs domain cannot license dative agreement-morphemes on the upstairs auxiliary; an applicative projection in the upstairs domain, on the other hand, will not be licensed, because the upstairs verb (saiatu "try") is not ditransitive. This is a particular example of a family of theories that tie the appearance of dative agreement-morphology on the auxiliary to the argument-structure of the verb with which it is associated. This family of theories is addressed at the end of this subsection (section 3.1).

18Note that there cannot be a locality boundary (e.g., a phase) between the auxiliary and DP_T in (16) (and in the adpositional construction in general)—if there were, no LDA-like effects would ever show up in the adpositional construction (since Agree would be blocked by the locality boundary, and clitic-doubling would be blocked by the clause-mate restriction), contra the attested state of affairs (e.g., in (14a), above).
Notice, however, that these selectional properties are properties of the verb (saiatu “try”), not of the auxiliary. Relying on the absence of a selected dative argument to explain the absence of dative agreement-morphology on the auxiliary implies the existence of some mechanism that transmits the selectional properties of the verb to the auxiliary. Under the current proposal, there is no need for such a mechanism; whether or not the auxiliary bears agreement-morphology corresponding to a particular Case-marking—absolutive, dative, or ergative—depends solely on whether there is a corresponding noun-phrase that bears that Case, and is within the relevant locality domain with respect to the auxiliary (as shown here, these locality domains are not necessarily the same across different Cases).

Nevertheless, one could still envision such a mechanism, whereby verbs with a particular kind of argument-structure are selected only by auxiliaries whose morphology matches that argument-structure. Thus, auxiliaries with dative agreement-morphology would only select verbs which themselves select a dative argument, while auxiliaries without dative agreement-morphology would only select verbs that do not select a dative argument. We have already seen evidence, however, that there cannot be a general mechanism of this sort at play in the Basque auxiliary system. In (14a), repeated below, the auxiliary bears absolutive agreement-morphemes, even though the verb (probatu “attempted”) selects only an ergative argument—in this case, pro-3pl.erg—and an adpositionally-headed clausal complement:

In fact, absolutive agreement-morphology is always present on the auxiliary in Basque, regardless of the argument-structure of the main verb (see also section 3.6). Obviously, one could stipulate that dative agreement-morphology is subject to the mechanism of selectional dependency outlined above, while absolutive agreement-morphology is not; but this would merely be a restatement of the facts in (26) and in (14a), respectively. The question is why this would be so. The current proposal provides an explanation for this asymmetry: absolutive agreement-morphemes are the result of Agree; as such, even if their target is inaccessible (e.g., due to a locality violation), they will still appear (reflecting default \(\phi\)-features, of course). Dative agreement-morphemes, on the other hand, are the result of clitic-doubling; as such, they will be absent when their target is inaccessible. As will be shown immediately (in section 3.2–section 3.3), this is independently supported by the behavior of each type of agreement-morphology with respect to defective intervention.
3.2. Ditransitive Verb-Phrases and Defective Intervention

Section 3.1 ended with the conclusion that absolutive agreement-morphemes are the reflex of *Agree*. As discussed in the INTRODUCTION, this leads to an expectation that the relation between these morphemes and the full absolutive noun-phrase will be subject to intervention effects.

Consider ditransitive constructions in Basque—for example, (9b), repeated here:

(9)  

b. **SIMPLE, MONO-CLAUSAL Ditransitive**  

Guraso-e-k niri [belarritako ederr-ak] erosi  

parent(s)-ART<sub>pl</sub>-ERG me.DAT earring(s) beautiful-ART<sub>pl</sub>(ABS)bought  

d- i-  zki- da- te.  

3.ABS- have-<sub>pl</sub>ABS- 1sg.DAT- 3pl.ERG  

‘(My) parents have bought me beautiful earrings.’ \[[Laka 1996]\]

As (9b) shows, the auxiliary is perfectly capable of bearing absolutive agreement-morphemes that match the \(\varphi\)-features of the full absolutive noun-phrase, even in ditransitive constructions. This may seem surprising, since it is well-established that in Basque, the dative argument of a ditransitive verb occupies a higher structural position than the absolutive argument (Elordieta 2001, among others). Given such a configuration, one might expect the dative noun-phrase to give rise to defective intervention—on a par with the Icelandic constructions mentioned in the INTRODUCTION—preventing *Agree* between the auxiliary and the absolutive DP from obtaining (here and throughout, the label “VP” is used for ditransitive verb-phrases; this is intended for simplicity, and does not amount to the claim that these verb-phrases lack more articulated internal structure; see section 4):

(27) **SCHEMATIZATION: INTERVENTION IN DITRANSITIVE CONSTRUCTIONS** *(unattested in mono-clausal ditransitives)*

However, as (9b) clearly shows, such intervention does not arise; the absolutive agreement-morphemes on the auxiliary are in fact able to reflect the \(\varphi\)-features of the absolutive noun-phrase. As mentioned in the INTRODUCTION, clitic-doubling of a noun-phrase has been cross-linguistically found to obviate subsequent intervention effects by that noun-phrase (Anagnostopoulou 2003); and as argued in section 3.1, the dative agreement-morpheme—which the auxiliary in (9b) does carry—is the result of clitic-doubling. Therefore, in (9b),
one would in fact predict that no intervention effects would arise, because clitic-doubling has rendered the full dative noun-phrase incapable of intervening:

(28) **SCHEMATIZATION: CLITIC-DOUBLING BLEEDS INTERVENTION**

We have already seen, however, a situation that would be analyzed (given the current proposal) as an instance of failed clitic-doubling of the dative noun-phrase—namely, when the latter is contained within the embedded clause in the adpositional construction; and one can, in fact, select a ditransitive predicate as the embedded verb in this construction.\(^{19}\)

(29) **DITRANSITIVE EMBEDDED WITHIN THE ADPOSITIONAL CONSTRUCTION → TARGETING OF ABSOLUTE DP\(_T\) BLOCKED**

\[
\text{[[ Lankide-e-i ]}_{\text{DP}_I} \rightarrow \text{[ liburu horiek ]}_{\text{DP}_T} \text{ irakur-tze-n }] \quad \text{probatu}
\text{colleague(s)-ART pl-DAT book(s) those pl(ABS) read-NMZ-LOC attempted}
\]

\[
d- \frac{it_1}{\phi} u- (z)te.
\text{3.ABS-} \frac{sg.\text{ABS}/*pl.\text{ABS}}{\text{have-} 3\text{pl.ERG}}
\]

"They have attempted to read those books to the colleagues."

(subject is [pro-3pl.ERG])

In (29), there is no dative agreement-morpheme on the matrix auxiliary. On the current proposal, this is expected—the dative DP\(_I\) and the matrix auxiliary are not clause-mates, therefore clitic-doubling of DP\(_I\) onto the auxiliary is blocked (see the discussion in section 3.1):

\(^{19}\)The dative noun-phrase in (29) is labeled DP\(_I\), where "I" stands for Intervener.
(30) **SCHEMATIZATION: AUXILIARY AND DATIVE DP\textsubscript{1} NOT CLAUSE-MATES →
CLITIC-DOUBLING OF DATIVE DP\textsubscript{1} IS IMPOSSIBLE**

Crucially, as the example in (29) demonstrates, this blocks the relation between the auxiliary and the absolutive DP\textsubscript{T}; the absolutive agreement-morphemes on the matrix auxiliary in (29) can only reflect default features (i.e., 3\textsuperscript{rd}-person singular), not the φ-features of DP\textsubscript{T}:

(31) **SCHEMATIZATION: INTERVENTION BY (NON CLITIC-DOUBLED) DATIVE DP\textsubscript{1}**

Note that while the absolutive agreement-morphemes in (29) must reflect default φ-features (i.e., 3\textsuperscript{rd}-person singular), they cannot be omitted. In other words, the relation between the absolutive agreement-morpheme and the absolutive noun-phrase behaves—according to the proposed diagnostic—as an Agree relation.

Further support for viewing the effect in (29) as syntactic intervention per se comes from the fact that not just any left-peripheral constituent disrupts the relation between the
absolutive agreement-morphemes and the absolutive noun-phrase—as shown by Etxepare (2006):

(32) **UNLIKE DATIVE DPs, ADJUNCTS DO NOT INTERVENE IN RELATION BETWEEN AUXILIARY AND ABSOLUTIVE DP**

```
 [ Miren-entzat [ harri horiek ]DP_T altxa-tze-n ] probatu
 Miren-BEN [ stone(s) those]pl(ABS) lift-NMZ-LOC attempted
 d-it- u-zte.
 3.ABS- pl.ABS- have- 3pl.ERG
 'They have attempted to lift those stones for Miren.'
```

While Case-marked noun-phrases such as the dative lankide-e-i ("colleague(s)-ART_pl-DAT") in (29) can disrupt the aforementioned relation, adjuncts such as Miren-entzat ("Miren-BEN") in (32) cannot—precisely the behavior that one would expect an *Agree* relation to exhibit.

The support that (29) provides for the current proposal is thus twofold: first, it shows that the relation between the auxiliary and the absolutive noun-phrase is indeed susceptible to intervention effects (as one would expect of an *Agree* relation); second, when juxtaposed with examples of mono-clausal ditransitive constructions (such as (9b), repeated below), it shows that the dative agreement-morpheme behaves in a way that is typical of clitic-doubling—in that its absence creates a situation in which the dative noun-phrase counts as an intervener, while its presence suppresses the ability of the dative noun-phrase to intervene.

(9) b. **WHEN DATIVE AGREEMENT-MORPHEMES ARE PRESENT, DATIVE DP DOES NOT INTERVENE**

```
Guraso-e-k niri [ belaritako ederr-ak ] erosi
parent(s)-ART_pl-ERG me.DAT earring(s) beautiful-ART_pl(ABS) bought
 d-i- zki- da-te.
3.ABS- have- pl.ABS- 1sg.DAT- 3pl.ERG
'(My) parents have bought me beautiful earrings.' [Laka 1996]
```

The established properties of *Agree* and clitic-doubling thus line up in accordance with the verdicts that the new diagnostic proposed here supplies, regarding absolutive agreement-morphology and dative agreement-morphology, respectively.

Finally, note that the dative noun-phrase behaves as a true *defective intervener*—while it is capable of obstructing the *Agree* relation between the auxiliary and the absolutive noun-phrase, the dative noun-phrase itself cannot value the features on the probe. I have been referring to the head that probes in this *Agree* relation as the "absolutive agreement-morpheme(s)"—a term that presupposes that it can only value its features using absolutive noun-phrases. In (29) (repeated below), the dative intervener is itself a plural noun-phrase (lankide-e-i “colleague(s)-ART_pl-DAT”); if the probing head were able to value its features using the dative noun-phrase, one would expect the plural number features on the dative

---

20 Albeit correctly, as I will show below.
noun-phrase to be transmitted to the probing head. This would give rise to plural features on the so-called “absolutive agreement-morpheme(s)”: 

(33) SCHEMATIZATION: TRANSMISSION OF FEATURES FROM INTERVENER, INSTEAD OF FROM DP\_T (unattested)

This is not, however, the attested state of affairs—as evinced by (29), repeated here:

(29) NUMBER FEATURES OF DATIVE INTERVENER CANNOT THEMSELVES BE TRANSMITTED TO UPSTAIRS AUXILIARY

\[ \text{d-} \phi^{/it} \text{ u-} (z)\text{te.} \]

‘They have attempted to read those books to the colleagues.’

As (29) demonstrates, the \( \phi \)-features of the dative \( \text{DP}\_1 \) do not matter; it intervenes, blocking the relation between the auxiliary and the absolutive \( \text{DP}\_T \), but it cannot value the features of the probe. The term “absolutive agreement-morpheme(s)” is therefore justified: the \textit{Agree} operation that gives rise to these morphemes can only value the features on the probe using absolutive noun-phrases, not using dative ones.\(^{21}\) As I will show in section 3.3, this restriction is not specific to the \textit{Agree} operation that gives rise to absolutive agreement-morphemes; rather, it is a general property of \textit{Agree} in Basque.

To summarize, sections 3.1 and 3.2 have shown converging evidence that the relation between the dative agreement-morpheme and the dative noun-phrase is a clitic-doubling relation, while the relation between absolutive agreement-morphemes and the absolutive noun-phrase is an \textit{Agree} relation. The evidence comes from the different locality restrictions

\(^{21}\)This is not the case in all dialects of Basque. As discussed in detail by Rezac (2006, 2008a), there exist dialects in which the probe can, under certain conditions, value its features using the feature-values found on the dative noun-phrase—an effect known as \textit{dative-displacement}, which is arguably a separate phenomenon.
that apply to the two relations; from the susceptibility of the absolutive relation to intervention (as one would expect of Agree), the defective nature of these intervention effects (i.e., the failure of dative interveners to transmit their own features to the probing head), and the expected distinction between intervening DP arguments and intervening PP adjuncts; and from the fact that the presence of dative agreement-morphemes obviates intervention by the dative noun-phrase (as one would expect of clitic-doubling). This, in turn, supports the reliability of the proposed diagnostic (when obstructing the relation between a given agreement-morpheme and the associated noun-phrase, the appearance of default $\phi$-features indicates an Agree relation, while a missing morpheme indicates a clitic-doubling relation).

3.3. *Agree in the Case-Marked Construction*

In the Case-marked construction, the number features of the agreement-morphemes corresponding to the Case-marking on the nominalized clause are determined by the plurality of an argument within the nominalized clause—for example, recall (10a), repeated here:

\[(10)\]

\[\text{a. A "regular" example of the Case-marked construction} \]

\[
\begin{array}{c}
\text{Uko} \\
\text{egin d- i- $\phi$- C - $\phi$} \\
\text{refusal(ABS) done 3.ABS- have- sg.ABS- 3pl.DAT- 3sg.ERG} \\
\end{array}
\]

\[\begin{array}{c}
[\text{agindu horiek}]_{\text{DP}_T} \text{bete-tze-a-ri}_{\text{DP}_C}. \\
\text{order(s) those}_{\text{pl}}(\text{ABS})\text{obey-NMZ-ART-DAT} \\
\text{He or she has refused to obey those orders.} \\
\text{(subject is [pro-3sg.ERG])} \\
\end{array}\]

\[\text{[Etxepare 2006:(99)]}\]

In (10a), the plurality of the dative agreement-morpheme is determined by the plurality of the absolutive DP$_T$ within the dative nominalized clause, DP$_C$.

As argued in section 2.4, this comes about by virtue of two separate relations, “stacked” on top of one another. The higher of the two is the relation between the auxiliary and DP$_C$ (the precise nature of this relation—whether it is Agree or clitic-doubling—depends on the Case of DP$_C$; see section 3.1). The lower of the two is the relation between D$_C^0$ (the article heading the nominalized clause) and DP$_T$. Since the latter involves valuation of the number features on D$_C^0$, it is necessarily an Agree relation, as shown in (34):

\[(34)\] **SCHEMATIZATION: Agree relation between D$_C^0$ and DP$_T$**
As such, this relation should be susceptible to intervention effects (on a par with those discussed in section 3.2). As mentioned earlier, the dative argument in Basque ditransitive constructions occupies a structurally higher position than the absolutive argument (Elordieta 2001, among others). Therefore, given a ditransitive embedded within the Case-marked construction, one would expect the relation between $D_0^0$ and $D_T^0$ to be disrupted, as diagrammed in (35):

(35) **SCHEMATIZATION: INTERVENING DATIVE DP DISRUPTING Agree BETWEEN $D_0^C$ AND $D_T^0$**

This prediction is borne out:

(36) **DITRANSITIVE EMBEDDED WITHIN THE CASE-MARKED CONSTRUCTION → TARGETING OF ABSOLUTIVE $D_T$ BLOCKED**

Uko egin d- i- $\phi$- $\phi$
refusal(ABS) done 3.ABS- have sg.ABS- $3sg.DAT/^3pl.DAT$ $3sg.ERG$
[lankide-a-ri]$_{DP_1}$ [liburu horiek]$_{DP_T}$ irakur-tze-a-ri ]$_{DP_C}$
‘He or she has refused to read those books to the colleague.’
(subject is [pro-3sg.ERG])

The fact that the dative agreement-morpheme is present but singular (as opposed to being entirely absent, as in the examples discussed in section 3.1) is a result of the fact that it is not the relation between the dative agreement-morpheme and the dative $D_T^C$ which breaks down—the auxiliary and $D_T^C$ are in a clause-mate relation, and thus obey the necessary locality conditions on clitic-doubling, the mechanism responsible for generating the dative agreement-morpheme (as argued in section 3.1).\footnote{The auxiliary and $D_T^C$ also obey the locality restrictions on Agree; we know this from the fact that the Case-marked construction allows the $q$-features of absolutive agreement-morphemes to be determined by $D_T^C$, if the latter is absolutive; and by the fact that in general, absolutive noun-phrases in object position can determine absolutive agreement-morphology. However, $D_T^C$ in (36) is dative, and therefore the relevant locality restriction is the clause-mate relation.}

The relation that breaks down in (36), owing to intervention by the dative $D_P^I$, is the relation between $D_0^0$ and $D_T^0$—which, as argued above, is an Agree relation. This should result in $D_0^C$ retaining its default number-features. The subsequent clitic-doubling of $D_T^C$ goes...
through unhindered, resulting in the creation of a clitic reflecting those (default) $\phi$-features found on $D(P)_{C}$.

Thus, the prediction generated by the current proposal is that instances of intervention of the kind exemplified in (36) will indeed give rise to a dative agreement-morpheme bearing default features, rather than the wholesale absence of a dative agreement-morpheme—and this is exactly what one observes in examples like (36).

Just as with the adpositional construction, above, further support for viewing the effect in (36) as syntactic intervention per se comes from the fact that not just any left-peripheral constituent will disrupt the relation between $D_{0}^{C}$ and the absolutive $D_{T}$—as shown by Etxepare (2006):

\[(37)\] **Unlike dative DPs, adjuncts do not intervene in relation between $D_{0}^{C}$ and absolutive $D_{T}$**

\[\text{Jon-ek [Miren-entzat [traste zahar-rak] bota-tze-a]}_{DP_{C}} \text{pentsatu}\]

\[\text{Jon-ERG Miren-BEN \{thing(s) old-ART_{pl}(ABS)discard-NMZ-ART(ABS) plan}\}

\[d- \underline{\text{it}}- u- \phi.\]

\[3.ABS- \underline{\text{pl.ABS}} \text{ have- 3sg.ERG}\]

‘Jon has planned to discard the old things for Miren.’

While Case-marked noun-phrases such as the dative *lankide-a-ri* (“colleague-ART$_{sg}$-DAT”) in (36) can disrupt the aforementioned relation, adjuncts such as *Miren-entzat* (“Miren-BEN”) in (37) cannot—precisely the behavior that one would expect an Agree relation to exhibit.

Finally, as in section 3.2, the behavior of the intervener is precisely what one would expect of defective intervention—the dative $D_{I}$ disrupts the Agree relation between $D_{0}^{C}$ and the absolutive $D_{T}$, but it cannot value the features of the probe—as evinced by (38), below:

\[(38)\] **Number features of dative intervener cannot themselves be transmitted to probe**

\[\text{[[Lankide-e-i]]}_{DP_{I}} \text{[liburu horiek]}_{DP_{T}} \text{irakur-tze-a]}_{DP_{C}} \text{gustatzen}\]

\[\text{colleague(s)-ART_{pl}-DAT book(s) those_{pl}(ABS) read-NMZ-ART(ABS) like(HAB)}\]

\[\phi- \underline{\text{zai-}} \phi/*zki- o.\]

\[3.ABS- \underline{\text{be-}} \underline{\text{sg.ABS/pl.ABS}} \text{ 3sg.DAT}\]

‘He or she likes to read those books to the colleagues.’

(subject is [pro-3sg.DAT])

If Agree could value the number features of $D_{0}^{C}$ using dative noun-phrases, the number features of $D_{I}$ in (38) would themselves be transmitted to $D_{0}^{C}$, and this would give rise to a plural absolutive agreement-morpheme on the matrix auxiliary (corresponding to the Case-marking on $D_{C}$, which in (38) is absolutive), contrary to fact.\(^{23}\)

We therefore have converging evidence that Agree in Basque can only value the features on the probe using absolutive noun-phrases, not dative ones—both from Agree between the

\(^{23}\)See the **Appendix** (p. 49), regarding dialects that exhibit “dative harmony”.}
so-called “absolutive agreement-morpheme(s)” on the auxiliary and the absolutive noun-phrase (where dative noun-phrases can intervene, but not value the features on the probe; see section 3.2), and from Agree between $D^0_C$ and $D_P$ in the Case-marked construction.

To summarize, this subsection has shown evidence that the relation between $D^0_C$ and $D_P$ is an Agree relation. The evidence comes from the susceptibility of this relation to intervention (as one would expect of Agree), the defective nature of these intervention effects (i.e., the failure of dative interveners to transmit their own features to the probing head), and the expected distinction between intervening DP arguments and intervening PP adjuncts. This further supports the reliability of the proposed diagnostic (when obstructing the relation between a given agreement-morpheme and the associated noun-phrase, the appearance of default $\varphi$-features indicates an Agree relation)—since the diagnostic correctly predicts the default $\varphi$-feature values on $D^0_C$, in instances where intervention has occurred.

### 3.4. Ergative Noun-Phrases and Ergative Agreement-Morphemes

In section 3.1–section 3.3, I have examined noun-phrases in the absolutive Case and in the dative Case, and the associated agreement-morphology on the auxiliary. In this subsection, I will examine the status of ergative agreement-morphemes.

Consider an instance of the Case-marked construction, where the downstairs argument is an ergative noun-phrase:

$\text{(39)} \quad \text{ERGATIVE } D_P \text{ IN THE CASE-MARKED CONSTRUCTION } \rightarrow \text{ NUMBER FEATURES OF } D_P$

\[
\text{Jon-ek } \underbrace{[\text{lehio-ko kristal-e-k}]}_{DP_T} \text{distira-tze-a } \overbrace{[\text{leho-ko kristal-e-k}]}_{DP_C} \text{ pentsatu}
\]

\[
\text{Jon-ERG window-GEN.LOC glass(es)-ART}_{pl-ERG}\text{ shine-NMZ-ART}(ABS) \text{ plan}
\]

\[
\text{d- } \overbrace{\varphi/*it}^{3.ABS-} \overbrace{u-}^{3sg.ABS/*pl.ABS} \varphi.
\]

‘Jon has planned for the glass in the window to shine.’

In the Case-marked construction, $D^0_C$ (the head of the nominalized embedded clause) probes for a noun-phrase with which it can establish an Agree relation (as argued in section 2.4, and supported in section 3.3). In the example in (39), there is no potential intervener in the downstairs clause that could block Agree with the ergative noun-phrase, yet the plural number features of the ergative $D_P$ (\textit{lehio-ko kristal-e-k “window-GEN.LOC glass(es)-ART}_{pl-ERG}”) cannot be transmitted to the auxiliary. One possibility is that this is the result of a locality boundary (e.g., a phase) blocking the relation between $D^0_C$ and the ergative $D_P$.\footnote{I thank the reviewer for turning my attention to this locality-based approach to data such as (39).} On the other hand, this could indicate that Agree in Basque cannot value features on the probe using an ergative noun-phrase (on a par with the behavior of dative noun-phrases, and in contrast to the behavior of absolutive ones). As it turns out, while both approaches account equally well for data such as (39), there exists, for each of the two approaches, data that are accounted for only under that approach. I will therefore conclude that both accounts are essentially correct, and that transmitting the plural number features of the ergative $D_P$ in (39) to $D_C$ (and subsequently, to the upstairs auxiliary) happens to be ruled out on both counts.
Let us first consider the former approach—that a locality boundary, such as a phase, blocks the relation between $D_0^C$ and the ergative $DPT$ in (39). This locality boundary could not be part and parcel of the Case-marked construction, since that would prevent the features of a noun-phrase within the nominalized embedded clause from ever being transmitted to the upstairs auxiliary, contrary to fact (see section 2.2). Instead, this locality boundary—e.g., a CP layer—would have to emerge whenever an ergative noun-phrase is present in the nominalized embedded clause. This is not unreasonable: it might indicate that the assignment of ergative Case is dependent on the appearance of $C^0$, much in the same way that the assignment of nominative Case—in nominative-accusative languages—has been argued to depend on $C^0$ (see, for example, Bittner & Hale 1996). However, Etxepare (2006) suggests the following contrast as evidence for a locality-based account of examples such as (39):

$$(40) \begin{align*}
\text{a. } & [[\text{Liburu-ak}]_{DPT} \text{ irakur-tze-a }]_{DP_C} \text{ gustatzen} \\
& \text{book(s)-ARTpl(ABS)read-NMZ-ART(ABS) like(HAB)} \\
& \phi^- \text{ zai-} [\phi/zki^-] \text{ t.} \\
& 3.\text{ABS- be- } [\text{sg.ABS/pl.ABS}] 1\text{sg.DAT} \\
& \text{‘I like to read books.’} \\
& \text{(subject is } [\text{pro-1sg.DAT}]) \quad \text{[Etxepare 2006:(98a)]}
\end{align*}$$

$$(40) \begin{align*}
\text{b. } & [[\text{Haur-rak}]_{DPT} \text{ geldi } \text{ego-te-a }]_{DP_C} \text{ gustatzen} \\
& \text{child(ren)-ARTpl(ABS)relaxed be-NMZ-ART(ABS) like(HAB)} \\
& \phi^- \text{ zai-} [\phi/*zki^-] \text{ t.} \\
& 3.\text{ABS- be- } [\text{sg.ABS/*pl.ABS}] 1\text{sg.DAT} \\
& \text{‘I like it when the children are relaxed.’} \\
& \text{(subject is } [\text{pro-1sg.DAT}]) \quad \text{[Etxepare 2006:(98b)]}
\end{align*}$$

Even though (40b) does not contain an ergative noun-phrase, plural absolutive agreement-morphemes on the auxiliary (which would correspond to the plurality of the absolutive $DPT$, haur-rek “child(ren)-ARTpl(ABS)” are impossible (cf. (40a)). Etxepare (2006) argues that this has to do with the subjecthood of the absolutive noun-phrase haur-rek (“child(ren)-ARTpl(ABS)”). This suggests that the crucial factor in mandating a CP layer is not the assignment of ergative Case, but rather the licensing of a canonical subject.

The other approach, as mentioned above, is that ergative noun-phrases are on a par with dative noun-phrases, in that $Agree$ cannot value the features on a probe by targeting them—and therefore, the only way ergative agreement-morphemes on the auxiliary can come about is by means of clitic-doubling. As discussed in section 2.4, the relation between $D_0^C$ and $DPT$ in the Case-marked construction involves valuation of the number features on $D_0^C$, and is therefore necessarily an $Agree$ relation. Since $Agree$ cannot value the features on the probe using an ergative noun-phrase, the number features of an ergative $DPT$ in the Case-marked construction cannot be transmitted to $D_0^C$—and by extension, to the upstairs auxiliary—correctly predicting the impossibility of plural ergative agreement-morphemes in (39).

This proposed parallelism between ergative noun-phrases and dative ones suggests that ergative noun-phrases should not only be prevented from transmitting their own features
to a probe, but also—like their dative counterparts—prevent the probe from targeting a structurally lower absolutive noun-phrase. This is borne out.\(^{25}\)

\[(41)\] **ERGATIVE DP IN CASE-MARKED CONSTRUCTION BLOCKS TARGETING OF ABSOLUTIVE DP**

\[
\text{[[Mikel-ek]_{DP}, [\underbrace{\text{nobela \ erromantiko-ak}}_{DP_T} \ \text{irakur-tze-a}]_{DP_C}} \ \text{proposatu}
\]

\[
\text{Mikel-\text{erg} \ \underbrace{\text{novel(s) romantic-ART}_{pl}(ABS)}}_{\text{read-NMZ-ART}(ABS)} \ \text{propose}
\]

\[
d-\quad \phi/^{*it} \quad u-\quad \text{t.}
\]

3.ABS- \quad \text{sg.ABS/}^{*pl.ABS} \quad \text{have- 1sg.ERG}

'I have proposed that Mikel read romantic novels.'

(subject is \[pro-1sg.ERG]\))

As shown in (41), the presence of an ergative DP (Mikel-ek “Mikel-ERG”) in the nominalized embedded clause in the Case-marked construction precludes transmission of the plural number features of the absolutive DP\(_T\) (nobela erromantiko-ak “novel(s) romantic-ART\(_{pl}(ABS)\)”) to the upstairs auxiliary. Note, however, that the subjecthood-based approach accounts equally well for data such as (41): under that approach, the impossibility of plural absolutive agreement-morphology would be because of the nominalized embedded clause containing a canonical subject; this, in turn, mandates a CP layer in the embedded domain; and the latter constitutes a phase, preventing Agree from targeting DP\(_T\), which is inside that phase.

On the other hand, it is not at all clear that the approach whereby ergative noun-phrases are akin to dative ones—in that they cannot value the features on the probe—can account, by itself, for an example like (40b), which contains no overt ergative noun-phrase (and in fact, no overt non-absolutive noun-phrase).

The advantage of the subjecthood-based approach is therefore that it offers a unified account for examples like (39) or (41), and examples like (40b). Under the other approach, (40b) remains unexplained.

The advantage of the other approach—which takes ergative agreement-morphology, like its dative counterpart, to be the result of clitic-doubling—is that it aligns very well with the morphological properties of the agreement-morphemes in question (as analyzed in detail by Arregi & Nevins 2008). First, note that dative agreement-morphemes and ergative agreement-morphemes in Basque bear a striking resemblance to each other (as well as to the series of strong pronouns in Basque). As an example, consider a sub-paradigm of the Basque present-indicative auxiliary:\(^{26}\)

---

\(^{25}\)Note that the ergative agreement-morpheme on the matrix auxiliary in (41) co-indexes the matrix subject (pro-1sg.ERG)—which in this example, is ergative—rather than the embedded ergative DP.

\(^{26}\)Some clarifications regarding the table in (42) are in order. First, note that the person-number combination of 2pl, while formally plural, is used for polite addressing of 2sg individuals (cf. French vous). To differentiate actual 2\(^{nd}\)-person plurality from mere “polite” uses of 2pl, Basque adds another pluralizing morpheme, which I have labeled “\(\text{numbers}\)”. I refer to this person-number configuration as “2pl+”. Second, note that dative and ergative 2sg forms alternate based on gender. Finally, note that this 3-place auxiliary exhibits Person-Case Constraint (PCC) effects, ruling out non-3\(^{rd}\)-person absolutive values; therefore, it is not clear that the d-morpheme in the first column expresses person in any contentful way.
Absolutive agreement-morphology, on the other hand, has a decidedly different morphological shape. As a representative example, consider another sub-paradigm of the present-indicative:

<table>
<thead>
<tr>
<th></th>
<th>ABS person</th>
<th>ROOT (have)</th>
<th>ABS number</th>
<th>DAT person, number, “number+”</th>
<th>ERG person, number, “number+”</th>
</tr>
</thead>
<tbody>
<tr>
<td>1sg</td>
<td>✗</td>
<td>i</td>
<td>✗</td>
<td>t/__, else da</td>
<td>t</td>
</tr>
<tr>
<td>2sg</td>
<td>✗</td>
<td>i</td>
<td>✗</td>
<td>{k,n}/__, else [a,na]</td>
<td>[k,n]</td>
</tr>
<tr>
<td>3sg</td>
<td>d</td>
<td>i</td>
<td></td>
<td>o</td>
<td></td>
</tr>
<tr>
<td>1pl</td>
<td>✗</td>
<td>i</td>
<td>✗</td>
<td>gu</td>
<td>gu</td>
</tr>
<tr>
<td>2pl</td>
<td>✗</td>
<td>i</td>
<td>✗</td>
<td>zu</td>
<td>zu</td>
</tr>
<tr>
<td>2pl+</td>
<td>✗</td>
<td>i</td>
<td>✗</td>
<td>zue</td>
<td>zue</td>
</tr>
<tr>
<td>3pl</td>
<td>d</td>
<td>i</td>
<td>zki</td>
<td>e</td>
<td>te</td>
</tr>
</tbody>
</table>

While absolutive person-morphology bears some similarity to dative/ergative person-morphology (namely, in the onset consonant of the plural forms), it is nonetheless quite different. Moreover, absolutive number-morphology is not only morpho-phonologically distinct from dative/ergative number-morphology, it actually appears (in both of these sub-paradigms) on the opposite side of the auxiliary-root from absolutive person-morphology. These morphological facts suggest that dative and ergative agreement-morphemes are the result of the same operation, while absolutive agreement-morphemes come about by means of a different operation. Given that absolutive agreement-morphology has already been shown to behave in ways typical of Agree (section 3.2–section 3.3), and that dative agreement-morphology has already been shown to behave in ways typical of clitic-doubling (section 3.1–section 3.2), the conclusion would be that ergative agreement-morphemes are the result of clitic-doubling, as well.

Since each of these two approaches—the subjecehood-based approach, and the clitic-doubling approach—has empirical advantages not shared by the other, it is important to note

---

27 The reason a different sub-paradigm of the present-indicative must be used, is that the three-place auxiliary—exemplified in (42)—exhibits Person-Case Constraint (PCC) effects, ruling out non-3rd-person ABS values. The meaning of the “⇝” symbol is that -te, corresponding to the “number+” feature of the ABS exponent, appears after the DAT morpheme (rather than before it). This is particular to the sub-paradigm presented in (43).
that the two are not mutually exclusive: the idea that ergative agreement-morphemes come about via clitic-doubling is fully compatible with the idea that canonical subjects require the projection of a CP layer, and vice-versa; it is perfectly possible that both are correct, and that examples such as (39) and (41) just happen to be ruled out on both counts: both because canonical subjects require the projection of a CP layer, and because Agree cannot value the features on a probe using an ergative noun-phrase.

Thus, the two approaches are not in direct competition; rather, each approach has a distinct domain of empirical coverage, and these two domains have a certain degree of overlap (e.g., examples such as (39) and (41)). Examples like (40b), above (whose ungrammaticality is the result of the presence of a canonical subject, but which contains no ergative noun-phrases), fall exclusively within the empirical domain of the subjecthood-based analysis. The morphological facts exemplified in (42–43), above—namely, the striking morphological similarity between dative agreement-morphology and ergative agreement-morphology—fall exclusively within the domain of the clitic-doubling analysis.

I will therefore adopt both analyses: that canonical subjects require the projection of a CP layer, and that independently, ergative agreement-morphemes are a result of clitic-doubling (as opposed to pure Agree).

This discussion might appear to relate to a wider research question, regarding the underlying nature of ergative Case in general, and ergative Case in Basque in particular. Laka (2006b) defends the view that ergative in Basque is inherent Case (see also Anand & Nevins 2006, Legate 2008, and Woolford 1997), while Rezac (2008a) defends the view that ergative in Basque is structural Case (note, in particular, the raising-to-ergative data discussed by Artiagoitia 2001).

Crucially, however, the distinction between structural Case and inherent Case does not map precisely onto the distinction between the two aforementioned approaches to an example like (39). The subjecthood-based approach, though structural in nature, relies on the structural nature of subjecthood, not of ergative Case. In fact, it is decidedly divorced from ergative Case, as demonstrated by the example in (40b), which contains no ergative noun-phrases.

Similarly, the notion that ergative agreement-morphemes come about by means of clitic-doubling is not incompatible with ergative being structural Case (like absolutive, and unlike dative). For the sake of this discussion, let us adopt the analysis of inherent Case and clitic-doubling put forth by Rezac (2008a): in short, Rezac analyzes inherent (i.e., theta-dependent) Case as an instance of a DP contained within a PP, whose P0 head may optionally probe for (some subset of) the ϕ-features on D0, thereby making those features visible to probes outside of the PP; clitic-doubling, on the other hand, is analyzed as an instance of the (P0+D0) head of a given argument affixing to the probe (as per the so-called big DP hypothesis; Boeckx 2003, Torrego 1988, Uriagereka 1995).28 Since D0 can undergo head-movement to P0 (under the proper featural configuration), it is clear that even in noun-phrases marked with inherent Case, the morphological material associated with D0 can find itself in a structural position that is accessible to clitic-doubling (namely, on the P0 head of the argument marked with inherent Case). This puts noun-phrases marked with inherent Case and those marked with

28This exposition is not intended to, and cannot, do justice to Rezac’s (2008a) proposal; it is included here simply as a means of conducting the current discussion in somewhat more concrete terms. I strongly urge the reader to refer to Rezac (2008a) for more details.
structural Case on a par, for purposes of clitic-doubling: in both cases, the morphological material associated with D<sup>0</sup> can, at least in principle, be targeted for clitic-doubling.

Thus, whether or not the morphological material associated with D<sup>0</sup> ends up affixed to the ϕ-probe (i.e., whether or not the noun-phrase ends up clitic-doubled) is orthogonal to whether or not the DP is wrapped inside a PP (i.e., whether the Case-marking on the DP is structural or inherent).

### 3.5. The Locus of Variation

As mentioned at the outset (and discussed extensively by Etxepare 2006), the LDA-like effects under discussion are restricted to “substandard” Basque. Other varieties of Basque do not allow the features of agreement-morphemes in the upstairs clause in the Case-marked construction and the adpositional construction to be determined by noun-phrases in the embedded clause.

Within the current proposal, this variation can be captured in terms of categorial selection by [-tze]<sub>0</sub>:

\[(44) \text{CAPTURING VARIATION IN TERMS OF SELECTION REQUIREMENTS OF } [-\text{tze}]_{n}^{0}\]

a. varieties without LDA-like effect: [-tze]<sub>0</sub> always selects vP

b. varieties with LDA-like effect: [-tze]<sub>0</sub> can select VP (in obligatory control contexts)

To see why (44a) would block the LDA-like effects under discussion, let us first consider the Case-marked construction:

\[(45) \text{[-tze]}_{n}^{0} \text{ SELECTS VP } \rightarrow \text{LDA-LIKE EFFECTS BLOCKED (CASE-MARKED CONSTRUCTION)}\]

As shown in section 2.4 and section 3.3, transmitting the features of DP<sub>T</sub> (the argument of the downstairs verb) to the upstairs auxiliary in the Case-marked construction is crucially dependent on establishing an Agree relation between D<sub>C</sub><sup>0</sup> (the article heading the nominalized clause) and DP<sub>T</sub>. However, if the complement of [-tze]<sub>n</sub> is a vP, such an Agree relation would span a locality boundary (e.g., a phase), and would therefore be illicit.

Next, consider the adpositional construction:
In the adpositional construction, the features of DP_T can only be transmitted to the upstairs auxiliary by means of Agree (since clitic-doubling would violate the clause-mate restriction; see section 3.1). Again, however, if the complement of [-tze]_n^0 is a vP, such an Agree relation would span a locality boundary (e.g., a phase), and would therefore be illicit.

Just like the analysis of the variety of Basque that exhibits LDA-like effects, the proposed account of the variety that lacks them does not require any difference between the Case-marked construction and the adpositional construction, as far as the syntax internal to nP is concerned (cf. section 2.4).

To summarize, within the current proposal, variation in the category selected by [-tze]_n^0 accounts for the attested variation on whether the Case-marked construction and the adpositional construction exhibit LDA-like effects.

3.6. Unergatives in Basque: Not Underlying Transitives, After All?

In previous subsections, we have seen the effects of disrupting clitic-doubling of the dative noun-phrase (section 3.1–section 3.2), as well as clitic-doubling of the ergative noun-phrase (section 3.4); we have also seen the effects of disrupting Agree by D^0 (the article heading the nominalized clause) by embedding a ditransitive verb or an overt ergative subject in the Case-marked construction (section 3.3, section 3.4); and we have seen the effects of disrupting Agree by the auxiliary—specifically, Agree by the absolutive agreement-morpheme—by embedding a ditransitive or an overt ergative subject in the adpositional construction (section 3.2, section 3.4).

There is one more way to disrupt Agree by the auxiliary, which has not been examined so far. In section 3.2, Agree by the auxiliary was disrupted by introducing an intervener (a dative noun-phrase that has not undergone clitic-doubling) in a position that is structurally between the auxiliary and the absolutive noun-phrase; but what would be the fate of the absolutive agreement-morphemes in a derivation that simply lacked an absolutive noun-phrase altogether? In other words, what if Agree with the absolutive noun-phrase failed not because of a locality/minimality violation (i.e., intervention), but because there simply was no absolutive noun-phrase to be targeted?
On the current proposal, the prediction is that in a derivation where there is simply no absolutive noun-phrase to be found, the auxiliary will bear the hallmark of failed Agree: absolutive agreement-morphemes reflecting default $\varphi$-features—which in Basque means 3rd-person singular. Interestingly, this is precisely what one finds with simplex (i.e., non-analytic) unergative predicates in Basque:

(47) **Auxiliary bears absolutive agreement-morphology even when only overt DP is ergative**

[ Lehio-ko kristal-a-k ] distiratu d- $\varphi$- u- $\varphi$.  
window-GEN.LOC glass-ART$_{sg}$-ERG shine 3.ABS- sg.ABS- have- 3sg.ERG

‘The glass in the window has shined.’  

[Etxepare 2003:(93b)]

The very fact that the overt argument (lehio-ko kristal-a-k “window-GEN.LOC glass-ART$_{sg}$-ERG”) is marked with ergative Case might suggest the presence of an implicit absolutive argument—if one takes ergative Case to be unambiguously indicative of the presence of another noun-phrase in the sentence (i.e., a *Case-competitor; Marantz 1991*). However, it has been independently observed that some ergative-absolutive languages have true monovalent unergative verbs, which select a single ergative noun-phrase and no absolutive argument; these are the so-called “split-S” languages, including Laz (*Blake 1994, via Legate 2008*) and Central Pomo (*Mithun 1991*). Therefore, any theory of Case must allow for the possibility of ergative noun-phrases that occur in the absence of any other noun-phrase in the sentence.

Crucially, however, the auxiliary in (47) bears not only ergative agreement-morphology—whose features correspond to the ergative lehio-ko kristal-a-k (“window-GEN.LOC glass-ART$_{sg}$-ERG”—but also 3rd-person singular absolutive agreement-morphology, even though there is no 3rd-person singular absolutive noun-phrase to be found (and in fact no absolutive noun-phrase at all).

At first glance, this 3rd-person singular absolutive agreement-morphology might seem to suggest that these unergatives are underlyingly transitive (*Hale & Keyser 1993*), interpreting this agreement-morphology as agreement with a tacit object that is phonologically unrealized (or alternatively, an overt object which has been incorporated into a light-verb). However, in light of the results in section 3.1–section 3.2, an auxiliary with 3rd-person singular absolutive agreement-morphology is precisely what one would expect if an absolutive noun-phrase were completely absent (syntactically and phonologically)—in other words, it is precisely what one would expect if unergatives were underlyingly *intransitive*.

Given that the conclusions in section 3.1–section 3.2 were motivated independently of considerations having to do with argument-structure or the underlying nature of unergatives, and that these conclusions provide an alternative account for the appearance of 3rd-person singular absolutive agreement-morphemes in such environments, the appearance of these agreement-morphemes can no longer be taken as an argument for the underlying transitivity of these verbs.

This, by itself, does not constitute an argument that unergatives in Basque are underlyingly *intransitive*. Nevertheless, I believe that evidence for such an argument does exist. Consider (14a), repeated here:
A "regular" example of the adpositional construction, targeting an absolutive DP

\[
\begin{align*}
[\text{Harri horiek}]_{DP_T} & \text{altxa-tze-n} \quad \text{probatu d-} \quad \text{it-} \quad \text{u-} \quad \text{zte}.
\end{align*}
\]

‘They have attempted to lift those stones.’

(subject is \([\text{pro-3pl.ERG}]\))

[Etsepare 2006:(85a)]

The matrix verb \text{probatu} (“attempted”) in (14a) is very similar to the simplex unergatives discussed earlier; but in addition to the ergative subject (\text{pro-3pl.ERG}, in (14a)), it selects an adpositionally-headed embedded clause. Crucially, it selects no overt absolutive argument. If unergatives were underlingly transitive—that is, if selecting an ergative subject were contingent on the presence of a tacit absolutive object—it would be entirely surprising that the absolutive agreement-morphemes on the auxiliary in (14a) are available to co-index the absolutive DP inside the adpositionally-headed embedded clause (\text{harri horiek} “stone(s) those_{pl}(ABS)”)—as discussed extensively in section 2.4—rather than bearing 3rd-person singular agreement with the aforementioned tacit object, like their counterparts in (47). These data therefore constitute an additional argument against theories that do not, under any circumstances, allow ergative Case-marking to arise in the absence of an absolutive Case-competitor (in addition to the Laz and Central Pomo data mentioned earlier).

Under the current proposal, on the other hand, this behavior is entirely expected: 3rd-person singular absolutive agreement-morphemes in examples like (47), above, are the result of \text{Agree} failing to find an appropriate target; in (14a), such a target is available (in the form of an absolutive noun-phrase in the adpositionally-headed embedded clause), and therefore the \text{Agree} relation obtains.

Data like (14a), then, can only be accounted for by abandoning the assumption that the presence of an ergative subject is only possible if the verb also selects an absolutive argument (tacit or overt)—in other words, it can only be accounted for if we accept that unergatives can be underlingly \textit{intransitive}.

A reviewer points out an additional advantage of the current proposal over the approach that takes simplex unergatives, of the kind exemplified by (47), to be underlingly transitive. Simplex unergatives typically alternate with a light-verb construction, as shown in (48a–b):

(48) \textit{Simplex vs. light-verb unergatives}

a. Jon-ek \text{dantzatu d-} \phi- \text{u-} \phi.

\text{Jon-ERG dance-PRT 3.ABS- sg.ABS- have- 3sg.ERG}

‘Jon danced.’

b. Jon-ek \text{dantza egin d-} \phi- \text{u-} \phi.

\text{Jon-ERG dance do 3.ABS- sg.ABS- have- 3sg.ERG}

‘Jon danced.’

In the light-verb construction in (48b), the complement of the light-verb \text{egin} (“do”) is the bare nominal \text{dantza} (“dance”). Again, it may appear that both in (48a) and in (48b), the auxiliary exhibits absolutive agreement with this nominal element—and that the difference between the two has something to do with incorporation, head-movement, and/or the phonological content of the light-verb itself. However, this approach runs into problems. As Etsepare (2003)
observes, many of these unergative predicates are able to appear in a construction where the complement of the light-verb is not nominal, but rather locative or adverbial (resulting in an iterative reading):

(49) **POSSIBILITY OF LOCATIVE/ADVERBIAL COMPLEMENT TO LIGHT-VERB**

   a. Dantza(n) egin d-\(\phi\)-u-te.  
      dance-LOC do 3.ABS- sg.ABS- have- 3pl.ERG  
      ‘They danced (repeatedly).’

   b. Laster(ka) egin d-\(\phi\)-u-te.  
      run-ADV do AUX  
      ‘They ran (repeatedly).’

   c. Borroka(n) egin d-\(\phi\)-u-te.  
      fight-LOC do AUX  
      ‘They fought (repeatedly).’

   d. Oihu(ka) egin d-\(\phi\)-u-te.  
      scream-ADV do AUX  
      ‘They screamed/yelled (repeatedly).’

   e. Errieta(n) egin d-\(\phi\)-u-te.  
      dispute-LOC do AUX  
      ‘They disputed (repeatedly).’

[C[Etsepae 2003:(117)]

Crucially, absolutive agreement-morphology on the auxiliary persists, whether the complement of the light-verb is nominal or not. If the source of absolutive agreement-morphology in (48a) were the nominal (dantza “dance”), the persistence of absolutive agreement-morphology in examples such as (49a–e) would remain unexplained. Note that while it was shown in section 2.4 that the adposition -n does not constitute a locality boundary (e.g., a phase), its complement is not treated by the grammar as an absolutive noun-phrase; this, in fact, is what sets the adpositional construction apart from instances of the Case-marked construction in which DP\(_C\) happens to bear absolutive Case (see section 2.4).

Under the current proposal, on the other hand, the persistence of absolutive agreement-morphology in examples such as (49a–e) is predictable: both in (48a) and in the locative/adverbal versions of (49a–e), there is no absolutive nominal to be found. As a result, the auxiliaries in both constructions bear the hallmark of failed Agree—namely, default (i.e., 3\textsuperscript{rd}-person singular) absolutive agreement-morphemes.

### 3.7. Summary and Typological Implications

In the preceding subsections, I have argued that the various agreement-morphemes on the Basque auxiliary differ with respect to the mechanism by which they are generated—and in particular, that they come about according to the following classification:

(50) **BREAKDOWN OF AGREEMENT-MORPHEMES BY UNDERLYING MECHANISM**

<table>
<thead>
<tr>
<th>agreement-morpheme</th>
<th>underlying mechanism</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABS</td>
<td>Agree</td>
</tr>
<tr>
<td>DAT, ERG</td>
<td>clitic-doubling</td>
</tr>
</tbody>
</table>

Arguments for this classification have come from observing well-established properties of Agree (Chomsky 2000, 2001) and clitic-doubling (Anagnostopoulou 2003)—such as their susceptibility (or lack thereof) to intervention, their effects (or lack thereof) on the subsequent status of their target as an intervener, and their differing locality restrictions—but also from the new diagnostic proposed in (8), and repeated here:
Given a scenario where the relation \( R \) between an agreement-morpheme \( M \) and the corresponding full noun-phrase \( F \) is broken—but the result is still a grammatical utterance—the proposed diagnostic supplies a conclusion about \( R \) as follows:

a. \( M \) shows up with default \( \varphi \)-features (rather than those of \( F \)) \( \Rightarrow \) \( R \) is \textit{Agree}

b. \( M \) disappears entirely \( \Rightarrow \) \( R \) is clitic-doubling

Crucially, this diagnostic was shown to correlate reliably with the well-established properties of \textit{Agree} and of clitic-doubling, which were mentioned earlier. Also, as discussed in the INTRODUCTION, the alignment in (8) represents an intuitively plausible state of affairs—in the sense that \textit{Agree} is none other than feature-valuation, and therefore its failure should not result in the disappearance of the agreeing morpheme.

Furthermore, it was shown that being able to access the feature-values on absolutive noun-phrases, but not on other noun-phrases, was a general property of \textit{Agree} in Basque—rather than just a property of the so-called “absolutive agreement-morpheme(s)” on the auxiliary. Evidence for this came from instances of \textit{Agree} in the Case-marked construction between the article heading the nominalized clause (\( D^0_C \)) and a noun-phrase within that clause (\( D^T_P \)).

From a typological perspective, this is a particularly interesting result. As discussed in section 2.1, Basque may appear at first glance to be a language that exhibits agreement with all Case-marked arguments in a given clause. However, when the agreement-morphemes generated by clitic-doubling are factored out, one is left with a system in which agreement (i.e., \textit{Agree}) targets only absolutive noun-phrases.

As Bobaljik (2008), Boeckx (2000), Holmberg & Hróarsdóttir (2003) and Schütze (1997), and others have shown, \( \varphi \)-feature agreement in Icelandic consistently targets only nominative noun-phrases—even though Icelandic does have non-nominative subjects. Basque, on the current proposal, is precisely the mirror image of Icelandic through the “NOM-ACC/ERG-ABS looking-glass”: in both languages, \textit{Agree} targets noun-phrases in the unmarked Case (nominative for Icelandic, absolutive for Basque), and only those noun-phrases—regardless of the inventory of Case-marked noun-phrases that happen to be present in a given clause.\(^{29}\)

Interestingly, Basque may also exhibit the mirror image of Icelandic predicates that take quirky subjects—namely, predicates that take an ergative argument but no absolutive one (see section 3.6).

4. A PCC-compatible Implementation

Throughout this paper, I have avoided phrasing the proposal in terms that would limit its scope to a particular framework of analysis, or a particular set of background assumptions—except where absolutely necessary—in the obvious interest of making the eventual conclusions as independent as possible of such assumptions. I have therefore avoided unnecessary commitments on issues such as the structure of ditransitive verb-phrases; the underlying nature of ergativity (or the ergativity-parameter); the mechanics of Case-assignment; the

\(^{29}\)Note that this restriction is itself reminiscent of the Hindi-Urdu agreement rule (Bhatt 2005), which states that a probe will agree with the first noun-phrase in its scope that does not bear an overt Case-marking adposition. See Bobaljik (2008) for related discussion, from a cross-linguistic perspective.
precise mechanism behind clitic-doubling (as opposed to the properties that clitic-doubling, as a relation, exhibits); and others.

Nonetheless, following a reviewer’s question, I will consider one possible implementation of the proposal in more specific and explicit terms. The reviewer asks how the current proposal relates to the Person Case Constraint (henceforth, PCC)—the effect that forces absolutive \( \varphi \)-features in ditransitive constructions to be 3rd-person (throughout this section, the term ditransitive refers to true three-place predicates; the behavior of clauses with two internal arguments but no external argument with respect to the PCC in Basque is different; see Rezac’s 2008b discussion of applicative unaccusatives). As it turns out, once these details are fleshed out, the current proposal works quite harmoniously with at least one well-known approach to the PCC—namely, the one taken by Anagnostopoulou (2003) and Béjar & Rezac (2003).

In addition to this account of the PCC, the implementation presented below draws on proposals by Arregi & Nevins (2008) and Rezac (2004, 2008a,b)—though it differs in certain details, which are crucial for capturing the observations made in sections 2–3. For concreteness, let us assume that person (\( \pi \)) and number (\( # \)) are separate probes (following Béjar 2003; see also Béjar & Rezac 2003, Sigurðsson & Holmberg 2008, Taraldsen 1995), and that the dative argument is introduced by ApplP, in its specifier (Anagnostopoulou 2003, Collins 1997, Marantz 1993, McGinnis 1998, Pylkkänen 2002, Ura 1996; and for Basque, see Elordieta 2001). I will assume the clause-structure in (51), in terms of base-generation sites:

(51) **DITRANSITIVE VERB-PH RASE: BASE-GENERATION**

\[
\begin{align*}
& v/#P \\
& \quad v/#' \\
& \quad \quad EXT-ARG \\
& \quad \quad \pi P \\
& \quad \quad v/#0 \\
& \quad \quad ApplP \\
& \quad \quad \pi^0 \\
& \quad \quad Appl' \\
& \quad \quad DAT-ARG \\
& \quad VP \\
& \quad \quad Appl^0 \\
& THEME \quad V^0
\end{align*}
\]

The derivational sequence would proceed as follows. First, \( \pi^0 \) probes for person-features in its domain. Anagnostopoulou’s (2003) and Béjar & Rezac’s (2003) account of the PCC assumes that dative noun-phrases, while preventing \( \pi^0 \) from probing further (and thus, from finding the absolutive direct object), cannot value the person-feature on \( \pi^0 \) with their own person-value. Interestingly, in section 3.2–section 3.3, dative noun-phrases were shown to behave in exactly the same way with respect to number-probes (and independently of the PCC), suggesting that this is a property of datives with respect to Agree in general. The presence of DAT-ARG in [Spec,ApplP] thus results in default features on \( \pi^0 \)—namely, 3rd-person—regardless of the person-features of DAT-ARG. Given that \( \pi^0 \) and DAT-ARG are clause-mates, DAT-ARG undergoes
clitic-doubling—affixing a pronominal clitic (whose features match those of DAT-ARG) to $π^0$, and rendering the full dative noun-phrase invisible to further Agree operations:

(52) **DITRANSITIVE VERB-PHRASE: AFTER $π$-PROBING**

Next, $v^0$—which is also the probe for number—searches its domain. At this point, DAT-ARG is invisible (as a result of having undergone clitic-doubling), and thus the $#$-probe finds the THEME argument, valuing its own number-feature with the value found on the THEME (marked $α$, in (53)):

(53) **DITRANSITIVE VERB-PHRASE: AFTER #$$-PROBING**

If so-called “absolutive agreement-morphemes” are in fact the combination of the $π^0$ head and the $v/#^0$ head, then in the derivation depicted in (51–53), absolutive person-morphology will reflect the value $3^{rd}$-person, found on $π^0$—regardless of the person-features of the THEME—
while absolutive number-morphology will reflect whatever value was transmitted from the THEME to $v/\#^0$ (marked $\alpha$, in (53)). Moreover, if absolutive agreement indeed consists of these two heads ($\pi^0$ and $v/\#^0$), we can account for the existence of sub-paradigms in which the number and person morphemes corresponding to the $\phi$-features of the absolutive noun-phrase show up on opposite sides of the auxiliary root—a property found with absolutive agreement-morphology, but never with dative or ergative agreement-morphology (for examples of such sub-paradigms, see section 3.4). Alongside the $\pi^0$ and $v/\#^0$ morphemes, (53) predicts that we will find a dative clitic (marked $\text{cl}_{\phi_1}$, in (52–53)), reflecting the full set of $\phi$-features (both number and person) of the full dative noun-phrase.

To summarize, the prediction is that we will find an agreement-complex that includes a morpheme corresponding to 3rd-person, a morpheme corresponding to the number-feature of the THEME, and a clitic reflecting the full $\phi$-feature set of the dative noun-phrase—precisely the attested state of affairs in PCC contexts (following Béjar & Rezac 2003, a 1st/2nd-person absolutive argument cannot appear unless licensed by a $\pi^0$ head bearing the same feature-value; in particular, they cannot appear if $\pi^0$ bears a 3rd-person value).\footnote{\textsuperscript{30} In the interest of brevity, the derivation in (51–53)—as well as the discussion of it—abstract away from the ergative external argument and the corresponding agreement-morphemes. The agreement complex will of course normally include these ergative agreement-morphemes, as well—but the focus of this discussion is the interaction between the current proposal and the PCC.}

Under these assumptions, clitic-doubling of the dative argument, and its resulting invisibility, are not only unproblematic (from the perspective of the PCC), but in fact crucial to the derivation: if the dative noun-phrase were not rendered invisible, step (53) would not go through; the full dative noun-phrase would intervene, preventing the number-feature of the THEME from being probed by $v/\#^0$ (following Anagnostopoulou 2003, and Rezac’s 2008a adaptation thereof for Basque). While such blocking of the number-probe is indeed unattested in PCC contexts, it is precisely what occurs in another configuration—namely, the adpositional construction—to which I turn next.

Consider a scenario in which the dative argument is too far away from $\pi^0$ to undergo clitic-doubling, because the dative argument and $\pi^0$ are not clause-mates—such as an instance of the adpositional construction in which the embedded verb-phrase is ditransitive (as discussed in section 3.2):
In this scenario, probing by $\pi^0$ will once again result in 3\textsuperscript{rd}-person on the $\pi$-probe—since the closest noun-phrase is the dative argument, which prevents the probe from searching further, but cannot transfer its own $\phi$-features to the probe. However, unlike in (51–53), the dative argument and $\pi^0$ do not stand in a clause-mate relation, and therefore clitic-doubling cannot occur:
As a result, the full dative noun-phrase is not rendered invisible (cf. (52)), and intervenes in probing by \( v/\#^0 \), as well; once again, the dative argument prevents the probe from searching further, but cannot transfer its own \( \phi \)-features (in this case, number) to the probe, resulting in \( \text{num} = \text{sg} \) on the \#-probe:
This matches the attested state of affairs precisely: as shown in section 3.2, a ditransitive verb-phrase embedded within the adpositional construction prevents both the person and the number features of the downstairs theme, or of the intervening dative argument, from being transmitted to the upstairs “auxiliary”—which under these assumptions, consists of the \( \pi^0 \)-v/#0 complex.

Finally, consider a simple, mono-transitive verb-phrase:

\[ (57) \textit{MONO-TRANSITIVE VERB-PHRASE: BASE-GENERATION} \]

In this case, \( \pi^0 \) and v/#0 can both probe the corresponding features on the THEME, without intervention by any other noun-phrase. This results in both the person and number features of THEME valuing their counterparts on \( \pi^0 \) and v/#0, respectively:
This, of course, gives rise to the standard pattern of agreement for mono-transitive clauses in Basque (again, given that so-called “absolutive agreement-morphemes” are the combination of \( \pi^0 \) and \( v/\#^0 \)). It is worth noting that the system set up in this section derives, without further assumptions, the fact that the morpheme that bears the PCC effect (i.e., the morpheme that is forced to reflect 3rd-person features in ditransitives, as in (52), above), is the same morpheme that reflects the person-features of the direct object in mono-transitives—namely, \( \pi^0 \).

It is also of interest that, under these assumptions, there is no sense in which the auxiliary needs to “know” the valence of the verb (in other words, whether it is transitive or ditransitive) in order to carry the correct number of agreement-morphemes. In this system, the presence of a dative clitic on the auxiliary is simply a result of the dative noun-phrase being probed by \( \pi^0 \), and undergoing subsequent clitic-doubling onto the \( \pi^0 \) head.\(^{31}\)

As mentioned earlier, this section is not intended to be an integral part of the current proposal; one can easily accept the general proposal presented in this paper, but opt for a different technical implementation thereof. Rather, it is intended to illustrate one such implementation, which turns out to mesh quite well with Anagnostopoulou’s (2003) and Béjar & Rezac’s (2003) approach to the PCC.

\(^{31}\)Instances in which the auxiliary root is phonologically different across different auxiliary valences can be handled in terms of contextual allomorphy, conditioned by the presence of the dative clitic. For a concrete proposal along these lines, see Arregi & Nevins (2008).
5. Conclusion

In this paper, I have proposed a novel diagnostic for distinguishing between Agree and clitic-doubling, based on the behavior of constructions in which the relation between an agreement-morpheme and the corresponding full noun-phrase breaks down. In particular, if the construction can be salvaged by replacing the agreement-morpheme with one that reflects default $\varphi$-features, this is taken to indicate that the relation is an Agree relation; on the other hand, if the construction can be salvaged by eliminating the agreement-morpheme altogether, this is taken to indicate that the relation is a clitic-doubling relation.

The workings of the proposed diagnostic were demonstrated using a family of LDA-like constructions in “substandard” Basque (Etxepare 2006). The verdict supplied by the new diagnostic was shown to correlate reliably with the verdicts generated by well-established properties of Agree (Chomsky 2000, 2001) and clitic-doubling (Anagnostopoulou 2003).

The particular analysis of Basque facilitated by these diagnostics places Basque on a par with familiar agreement systems: once the agreement-morphemes generated by clitic-doubling are factored out, one is left with a system in which Agree targets only absolutive noun-phrases—precisely the ergative-absolutive mirror image of familiar nominative-accusative agreement systems, in which Agree targets only nominative noun-phrases (e.g., Icelandic; see Bobaljik 2008, Boeckx 2000, Holmberg & Hróarsdóttir 2003, Schütze 1997, among others).

Finally, this analysis calls into question the traditional approach to unergatives in Basque, providing evidence that these verbs are in fact underlyingly intransitive (rather than transitive).

Appendix: “Dative Harmony” Dialect(s)

There is one instance of a ditransitive Case-marked construction with a plural downstairs argument DP, in which for some speakers, using a plural agreement-morpheme on the auxiliary is marginal, rather than outright ungrammatical. This is an instance of the Case-marked construction in which the nominalized clause appears in the dative Case, and both internal arguments of the embedded ditransitive verb are plural:

(60) BOTH ARGUMENTS OF DOWNSTAIRS DITRANSITIVE ARE PLURAL, $DPC$ IS DATIVE $\rightarrow$
PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS AUXILIARY IS TOLERABLE (FOR SOME SPEAKERS)

*/? Uko egin d- i- $\varphi$- e $\varphi$ [ [ lankide-e-i ] refusal(ABS) done 3.ABS- have- sg.ABS- 3pl.DAT 3sg.ERG colleague(s)-ART.pl-DAT

[ opari-ak ] egi-te-a-ri ]$_{DPC}$ haien urtebetzea-n.
present(s)-ART.pl(ABS) do-NMZ-ART-DAT their birthday-LOC
‘He or she has refused to make presents for the colleagues for their birthday.’

(subject is [pro-3sg.ERG]) [Etxepare 2006:fn. 28, (i)]

As observed by Etxepare (2006), this is arguably an entirely separate phenomenon—since changing the plurality of either the absolutive opari-ak (“present(s)-ART.pl(ABS)”) or the dative lankide-e-i (“colleague(s)-ART.pl-DAT”) renders use of the plural dative agreement-
morpheme on the upstairs auxiliary (-e-) completely ungrammatical, even for those speakers who marginally tolerate (60):

(61) a. **PLURALITY OF DATIVE ARGUMENT ALONE IS NOT ENOUGH TO RENDER PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS AUXILIARY TOLERABLE**

* Uko egin d- i- φ- ε- ϕ refusal(ABS) done 3.ABS- have- sg.ABS-3pl.DAT 3sg.ERG

[[ [ lankide-a-ri ] [ opari-ak ] egi-te-a-ri ]DPc.
colleague-ARTsg-DAT present(s)-ARTpl(ABS) do-NMZ-ART-DAT
‘He or she has refused to make presents for the colleague.’
(subject is [pro-3sg.ERG])

b. **PLURALITY OF ABSOLUTE ARGUMENT ALONE IS NOT ENOUGH TO RENDER PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS AUXILIARY TOLERABLE**

* Uko egin d- i- φ- ε- ϕ refusal(ABS) done 3.ABS- have- sg.ABS-3pl.DAT 3sg.ERG

[[ [ lankide-e-i ] [ opari-a ] egi-te-a-ri ]DPc.
colleague(s)-ARTpl-DAT present-ARTsg(ABS) do-NMZ-ART-DAT
‘He or she has refused to make a present for the colleagues.’
(subject is [pro-3sg.ERG])

Similarly, a dative DP_C that embeds a mono-transitive verb taking a sole dative argument is judged marginal by the same speakers who accept (60) (speakers who reject (60), reject (62) as well):

(62) **SINGLE DATIVE ARGUMENT OF DOWNSTAIRS VERB IS PLURAL, DP_C IS DATIVE → PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS AUXILIARY IS TOLERABLE (FOR SOME SPEAKERS)**

*/? Uko egin d- i- φ- ε- ϕ [[buruzagi-e-i]DP_T
refusal(ABS) done 3.ABS- have- sg.ABS-3pl.DAT 3sg.ERG chief(s)-ARTpl-DAT

obedi-tze-a-ri ]DPc.
obey-NMZ-ART-DAT
‘He or she has refused to obey the chiefs.’
(subject is [pro-3sg.ERG])

[Etxebarri 2006:(105)]

Since the acceptance of (62) is restricted to those speakers who accept (60), both are plausibly the result of a “dative harmony” effect, which can be characterized as follows: for these speakers, a plural dative DP_T can marginally transmit its number features to D^0_C provided that (a) DP_C is itself dative, and (b) there are no singular noun-phrases within DP_C (not even absolutive ones). This sensitivity to the plurality of other noun-phrases in the embedded clause (as well as the marginality of the construction, even for those speakers who accept it) suggests that “dative harmony” is some kind of processing effect, rather than a grammatical effect per se. Note that even for these speakers, targeting a dative noun-phrase in the adpositional construction (as in (16) in section 2.2) is completely ruled out.
Interestingly, there is evidence of a very similar effect with respect to defective intervention in Icelandic. As noted in the Introduction, a dative experiencer argument in Icelandic will give rise to intervention, blocking Agree between the matrix tensed verb and an embedded nominative subject (see (6–7), in section 1), resulting in default (i.e., singular) number agreement on the matrix verb. However, if both the dative experiencer argument and the embedded nominative subject are plural, using plural agreement-morphology on the matrix verb becomes marginally tolerable, for some speakers:

\begin{equation}
\text{(63) "DATIVE HARMONY" IN ICELANDIC: PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS VERB MARGINALLY TOLERABLE IF BOTH INTERVENER AND TARGET ARE PLURAL}
\end{equation}

? það finnast mörgum stúdentum [ tölvurnar ljótar ].
EXPL find.pl many students.pl.DAT the.computers.pl.NOM ugly
‘Many students find the computers ugly.’

\textit{[Holmberg & Hróarsdóttir 2003:fn. 6, (i)]}

Crucially, as with the Basque “dative harmony” effect exemplified by (60–62), the effect is dependent on the plurality of both the dative experiencer and the nominative embedded subject. Compare (63) with (64a–b), below:

\begin{equation}
\text{(64) a. PLURALITY OF DATIVE INTERVENER ALONE IS NOT ENOUGH TO RENDER PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS VERB TOLERABLE}
\end{equation}

* það finnast mörgum stúdentum [ tölvan ljótar ].
EXPL find.pl many students.pl.DAT the.computer.sg.NOM ugly
‘Many students find the computer ugly.’

\textit{[Holmberg & Hróarsdóttir 2003:fn. 6, (iii)]}

\begin{equation}
\text{(64) b. PLURALITY OF TARGET NOMINATIVE ALONE IS NOT ENOUGH TO RENDER PLURAL AGREEMENT-MORPHOLOGY ON UPSTAIRS VERB TOLERABLE}
\end{equation}

* það finnast einhverjum stúdent [ tölvan ljótar ].
EXPL find.pl some student.sg.DAT the.computer.sg.NOM ugly
‘Some student finds the computer ugly.’

\textit{[Holmberg & Hróarsdóttir 2003:fn. 6, (ii)]}

It therefore appears that an effect very similar to Basque “dative harmony” is also attested in certain dialects of Icelandic.
